History of the Parker Lands Major Redevelopment Site

INTRODUCTION

Research was conducted into the historical usage of the Parker Lands site dating back to the time of the arrival of the Selkirk Settlers to the Red River Valley in 1812. Original source material was used in this research including cadastral ownership maps, planning documents of the settlements, survey plans, Henderson Directories, and aerial photography.

Secondary source material also used which included newspaper accounts and academic literature on the general history of Winnipeg in the 19th and 20th Century as it relates to growth and development.

There is little to no evidence in the history of the lands to suggest the current conditions reflect a long-standing natural & pristine condition, but rather instead the site being historically denuded of trees and significantly altered by human activities and facilities in the late 19th Century and early-to-mid 20th Century all with a vision for residential land-uses.

PLANS FOR FUTURE RESIDENTIAL DEVELOPMENT

In the 1870's, the Parker Lands consisted of a few small farms and wood lots in the Parish of St. Boniface on River Lots 17-24, and River Lot 46. On March 9, 1882 the first Plan of Subdivision was created by the McPhillips Bros. and established residential lots of 25 feet by 100 feet on a grid pattern of streets stretching the entire length of River Lot 17 from the Red River to past Pembina Highway.

This plan created Heatherdale and Parker Avenue Rights of Way of 48.5 feet wide bisecting the River Lot east/west with several crossing north/ south streets. Winnipeg was undergoing a significant population boom overflowing in 1881 and 1882 with a corresponding real estate boom connected to the anticipation of the CPR construction of the main line approaching Winnipeg to open up the Canadian Prairies to the World via rails in 1886.

The southern limit of River Lot 17 was the City of Winnipeg Boundary in 1882 and when Plan 358 was introduced in 1890, it established the Northern Pacific and Manitoba Railway Portage Extension from the Main Line of the Northern Pacific and Manitoba Railway line, which ran parallel to present day Pembina Hwy. The north boundary of the Planned Area became the Northern Pacific and Manitoba Railway Portage Extension railway tracks that are today the CNR Rivers Subdivision Main Line heading east connecting to the Portage Junction of the CNR Letellier that runs south to the US border at the east end of the Planned Area; and heading northeast towards Downtown Winnipeg and Eastern Canada. The CNR Rivers Main Line heading west connects about 2 Km west of the Planned Area with the BNSF Manitoba Line and the CPR La Riviere subdivision at St. James Junction in one of the rare locations in Canada with three (3) Class I rail carriers physically connecting.

Plans of Winnipeg from a century ago show the proposed residential street layouts for this area. The vision of the Parker Lands as residential was established with the first plan in 1882 and the subsequent plans continued that vision when in October, 1907 the area became 'Rosedale', just north of Parker Ave. and what is shown on the plan as 'Prospect Park', was part of the northern extent of what is known today as the Beaumont Neighbourhood.

Subdivision Plan 1295 created in 1907 for this growing residential area originally referenced as 'Rosedale' was registered on parts of lots RL 18, 19, and 20 in the Parish of St. Boniface, and continued the traditional grid pattern street system north of Heatherdale and Parker Avenues with 32 blocks containing a number of 25 foot wide lots between Waverley St. and the CNR Letellier. (See Appendix 'A' for historical maps and Subdivision Plans for the Parker area).

The same street layout for Rosedale appears on maps of Winnipeg dating back as far as 1908. Many of these planned streets (indicated as "Asquith", "Georgina", "Heatherdale", etc. on the plans) still exist as unimproved open public Right-of-Ways in the Manitoba Hydro Corridor, and could be used to access the developable lands as they are still controlled by the City of Winnipeg.

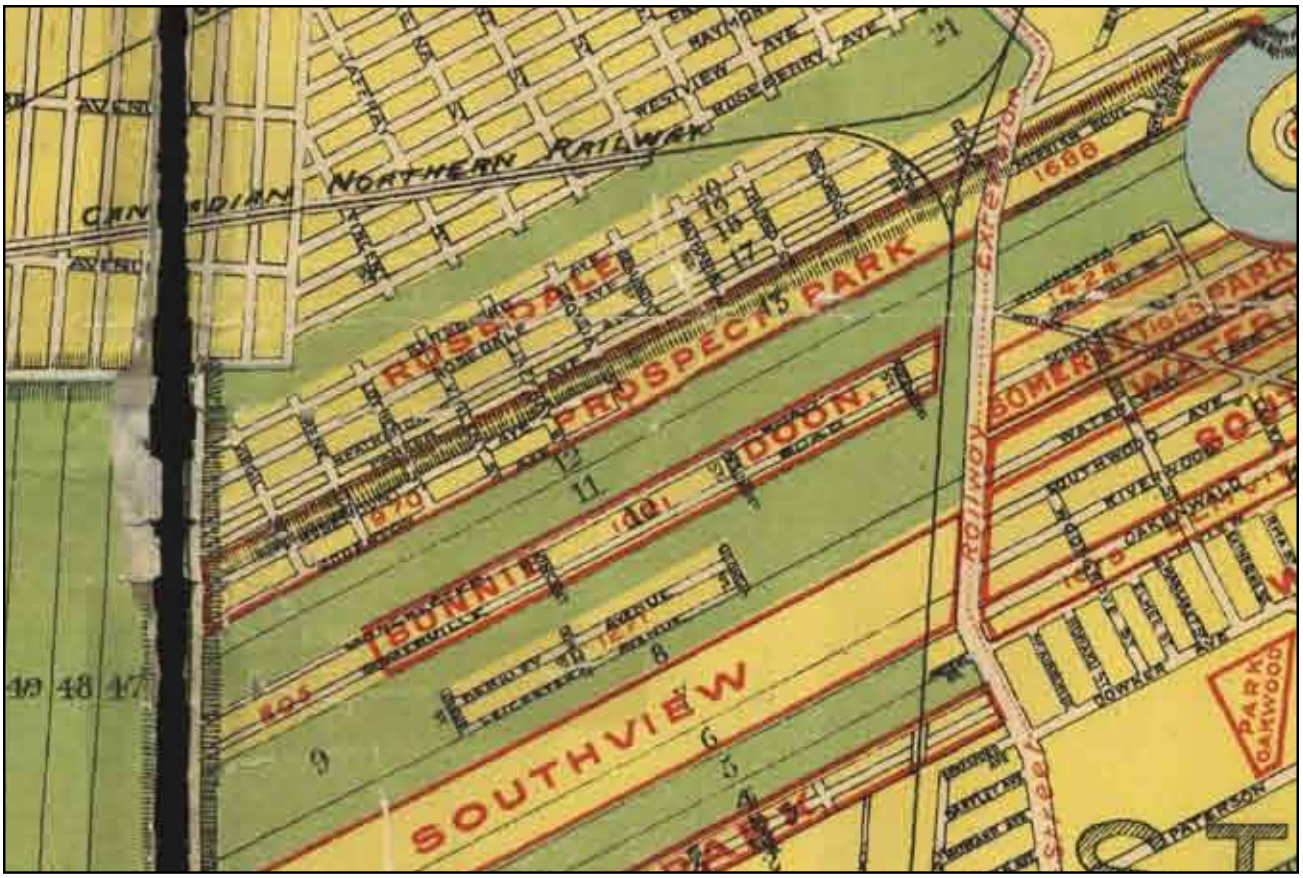

Figure 1: *1912 Chataway's Map of Greater Winnipeg*

With a search conducted in the Henderson's Winnipeg City Directory from the early 1900's through to 1964 it was discovered that houses with formal street addresses first started to appear on Parker Avenue around 1910, at which time there were 4 in total along with two additional named owners (but no address at that time) who were likely to build in the near future. (See Appendix 'B' for an overview of Henderson's Directories through the years which show inhabitants along Parker Avenue).

The neighbourhood experienced slow but steady growth before, during and after the Second World War. By 1956, for example, the number of houses along Parker Avenue totaled 49. A few years later by the mid 1960's there were over 65 homes on the same street, as a small construction boom was taking place throughout the Beaumont Neighbourhood.
The last occupied home on Parker Avenue (at 1500 Parker Avenue) was constructed in 1917 and remained in use until it was recently acquired by the City of Winnipeg to make way for the construction of the second stage of the Southwest Rapid Transit Corridor.

PARKER AVENUE DAIRY

Besides the new residential homes in the Parker neighbourhood, the first reference to a Parker Avenue Dairy is listed in 1928, located at 1164 Parker Avenue to supply milk, cream and butter, both wholesale and retail for people in South Winnipeg (*Winnipeg Free Press, 1937*).

Two years later, two more dairies, Winnipeg Dairy and Red Star Dairy, are recorded as well but with no specific street address and only a reference to 'S .S.' (south side) to indicate their location on the street.

Aerial photographs from 1950 confirm the presence of dairy farms as barns and fenced cattle pens are clearly visible as well as the images of cows grazing on the grassy fields to the north of Parker Ave., which today make up part of the poorly drained lands at the centre of the site. (See Appendix 'C' for various historical aerial photographs through the years).

Originally, this land was likely level ground covered in grasses which was good for cattle grazing. But perhaps with the influx of new homes to the south in the Beaumont Neighbourhood as well as the later development to the west and north especially the raised embankments of the railway tracks, these substantial changes altered the drainage patterns which then established much of this area becoming a low point for drainage on site. The result of these man-made changes to the natural drainage patterns is evidenced today with much of this land covered in pockets of water for a good part of the year.

References to the dairy farms in the *Henderson Directory* continue through until 1949 after which it is observed that they are no longer listed. Noted in its place, however, at 1164 Parker Avenue is Glenmore Stables which likely repurposed most of the existing livestock infrastructure. By 1952 the reference is updated to Glenmore Coop Riding Club which appears at that street address until the late 1950's.

Also of interest on the street in 1956 is a reference to Parker Grocery at 1134 Parker Ave. As was the case with most new neighbourhoods at the time, it was important to have a corner store within an easy walking distance from most homes.

INFORMAL COMMUNITIES

Also around this time, further to the north of the Parker Lands and the CNR Rivers, an informal community known as “Rooster Town” existed alongside present day Grant Ave. It had a significant Métis population and had been described as the ‘last road allowance community in Winnipeg.’
During the 1950’s, some 30 to 50 people inhabited this area in more than a dozen shacks, many of them old boxcars purchased from the CNR. At the end of the 1950’s, the last residents of Rooster Town were relocated to make way for the construction of new developments in the area like Grant Park Shopping Centre.

Figure 2: *Images of Rooster Town circa 1950’s (north of site by current Grant Avenue)*

There was also another smaller informal community known as “Tin Town” which stood further to the south near present day McGillivray Boulevard. Shelters here were even less sophisticated than rooster town, often built of any leftover construction debris that could be found. Though these two settlements were directly to north and south of the Parker Lands, there isn’t any evidence that the Parker Lands site itself was used by squatters perhaps as it was intensively cut off by the rail lines.

Eventually, increased development spawned commercial and industrial growth in Crescentwood and Fort Rouge, including utility complexes on Corydon and Grant Avenues and retail/service corridors on Osborne St. and Corydon Ave. Pressure from this growth forced any remaining squatters from the informal communities as the City’s boundaries continued to expand southward.

MANITOBA HYDRO

With the need for more electricity to power the growing number of homes in south Winnipeg the newly created Manitoba Hydro Electric Board (established in 1953) constructed a head office at 1650 Harrow Street (also 820 Taylor Avenue) between 1957 and 1958.

The company became Manitoba Hydro in 1961, a crown corporation of the government of Manitoba. The head offices are adjacent to a major power station that has transmission lines running south and bisect the Parker Lands site.

Figure 3: *Original Manitoba Hydro-Electric Board building at 1650 Harrow St.*

Figure 4: *Existing overhead electrical infrastructure – looking south through the Parker Lands (mid site).*

SUMMARY

The research concludes these specific lands are typical for most of the Winnipeg area as being farmed by early settlers in River Lots until growth booms saw the lands transform through subdivision for residential uses. The increasing expansion of the railways network of tracks crisscrossing Winnipeg and economic hard times transformed the lands again from rural pasture to sparse single family to industrial.

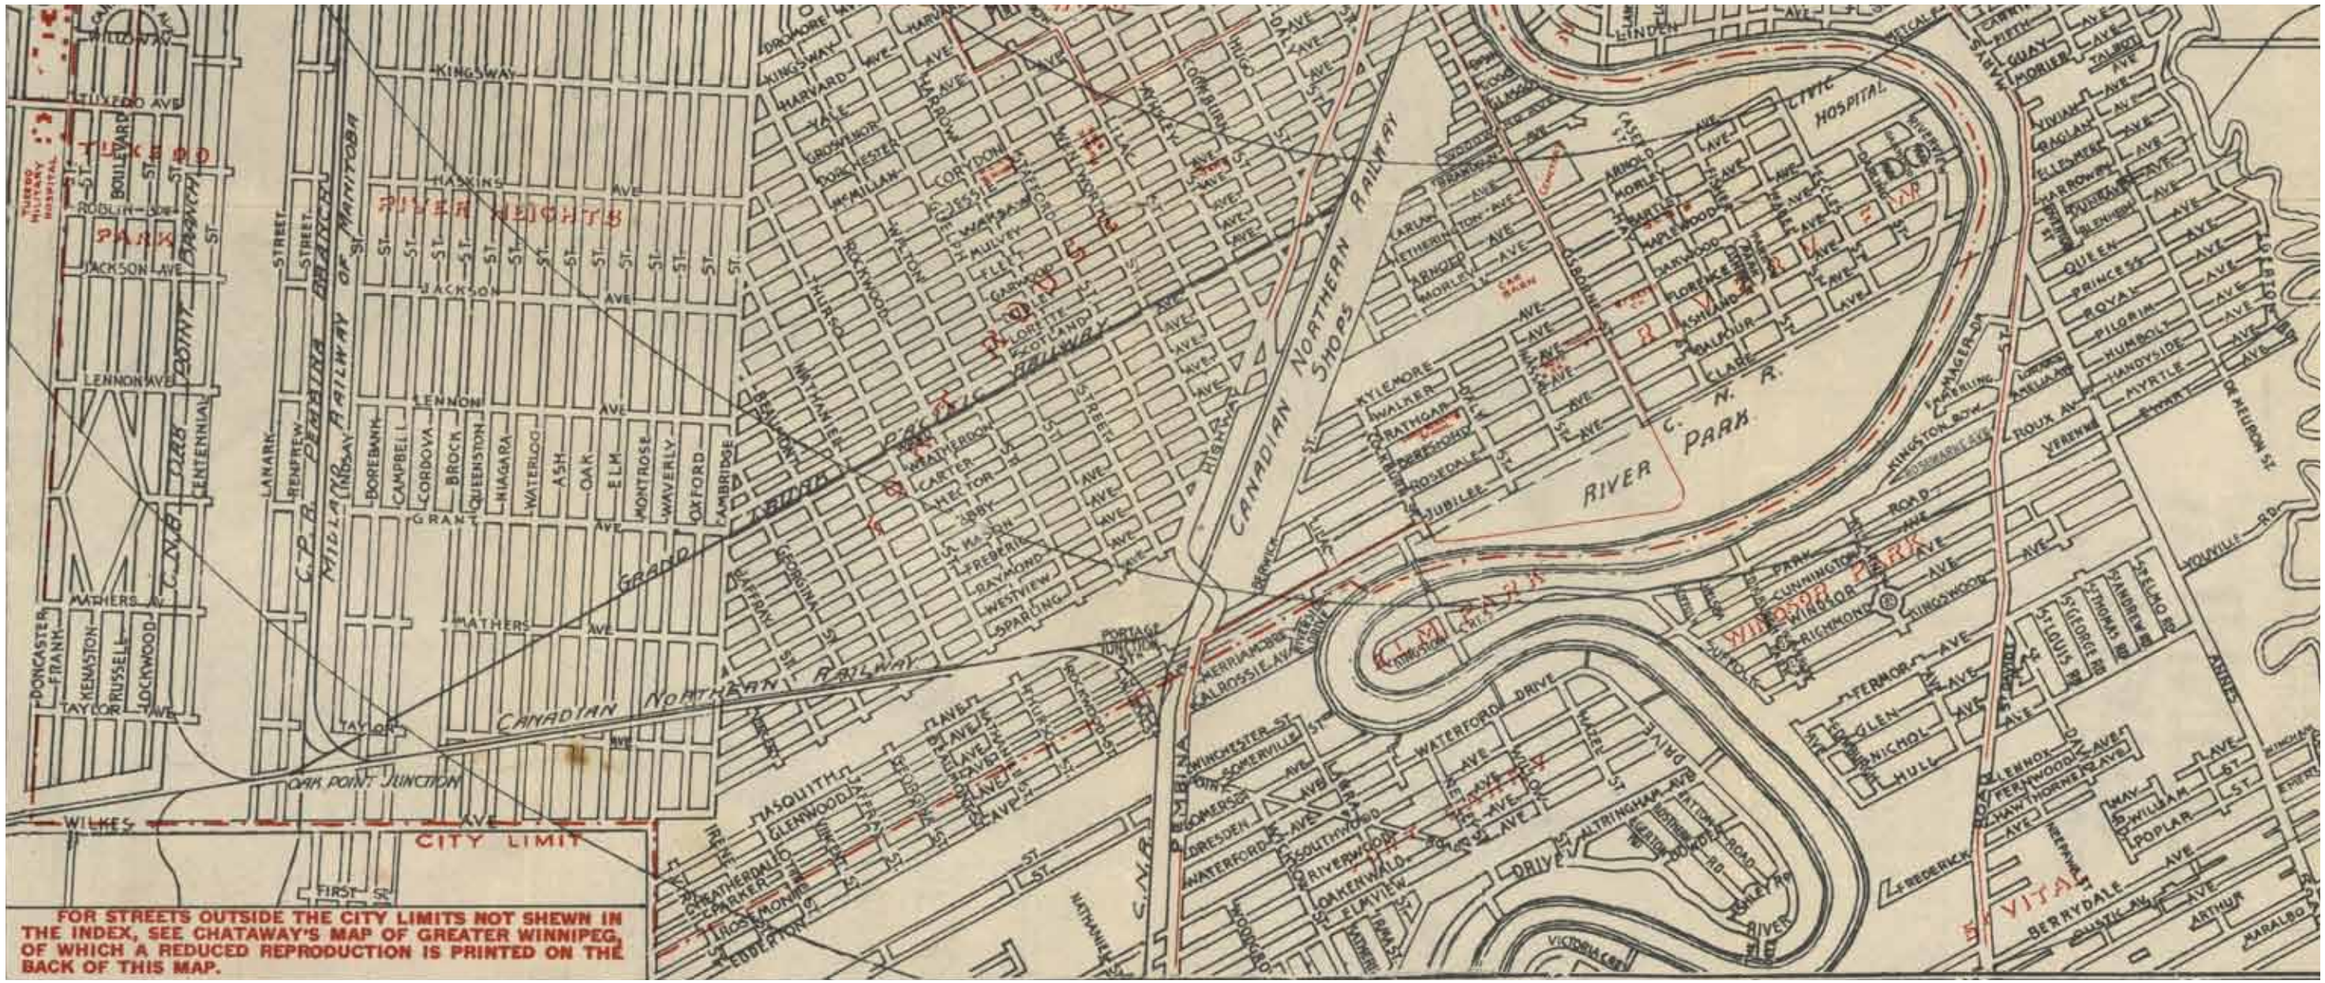

The arrival of the electrical grid infrastructure in the early 20th Century and economic hard times combined to cause these lands to be left idle in the perception the isolated location near industrial was less than ideal for residential uses as Winnipeg grew around and leapfrog past these lands to more easily developable parcels.

Today the Parker Lands Major Redevelopment Site are zoned for industrial use and has remained as agricultural and industrial land (A-agricultural and M1, M2-manufacturing under the Winnipeg Zoning By-Law) although a large portion of the site has been used as an official and unofficial dog park for the last several years.

APPENDIX ‘C’ - Historical Aerial Photographs

1929 Aerial Photo from National Earth Observation Data Framework, Govt. of Canada

Observations

- There is an east-west path about 1/3 of the way up from the south part of the site which is consistent with a path that still exists in current day;
- Many other diagonals paths exist on the property;
- Equal amounts of space are interspersed between forest and open area;
- Cambridge Street was the through street that connected Crescentwood and River Heights to the southern districts rather than current day Waverley Street (which seemed to exist south of around Hurst Way and Wilkes;
- Parker Avenue continued through directly to Pembina Highway and beyond with a strong axis;
- A well-defined strip of cleared land to the south of the forest is evident, likely for a Hydro right-of-way. It is difficult to make out and lines or towers in that area though to the north and crossing of the CN tracks there are some items that are casting fairly long shadows;
- At this time there were only one or two rail lines in existence;
- Only a handful of houses are observed around Parker Avenue and to the south as this represented suburban living far past the outreaches of the city limits at the time.

1950 Aerial Photo from National Earth Observation Data Framework, Govt. of Canada

Observations

- Cambridge St. is still utilized as the main through street though it is now cut off by about 10 lines of railway tracks;
- Parker Avenue continues in a straight line far to the west; It also connects through to Pembina Highway to the east as a major street;
- A distinctive diagonal path can be observed through the forest to the west (SE to NW direction);
- In much of the central grassland areas of the site, light coloured cows can be seen to be grazing;
- There are a couple farm buildings plus barn and pens along Parker Avenue between Daniel and Derek St. (which confirms what was found on Henderson Directory as well). There is another pen to the north of Heatherdale;
- Within the Parker Lands boundary to the east, railway tie storage and other goods can be observed south of the curved tracks;
- There are hydro lines and towers present in the open fields to the south of the forest and grasslands; Some lines could be crossing the site from north of the tracks as well;
- Only some parts to the east of the Beaumont Community are developed at this time;
- The forest to the east of the site is quite pronounced (current day oak trees).

1962 Aerial Photo from National Earth Observation Data Framework, Govt. of Canada

Observations

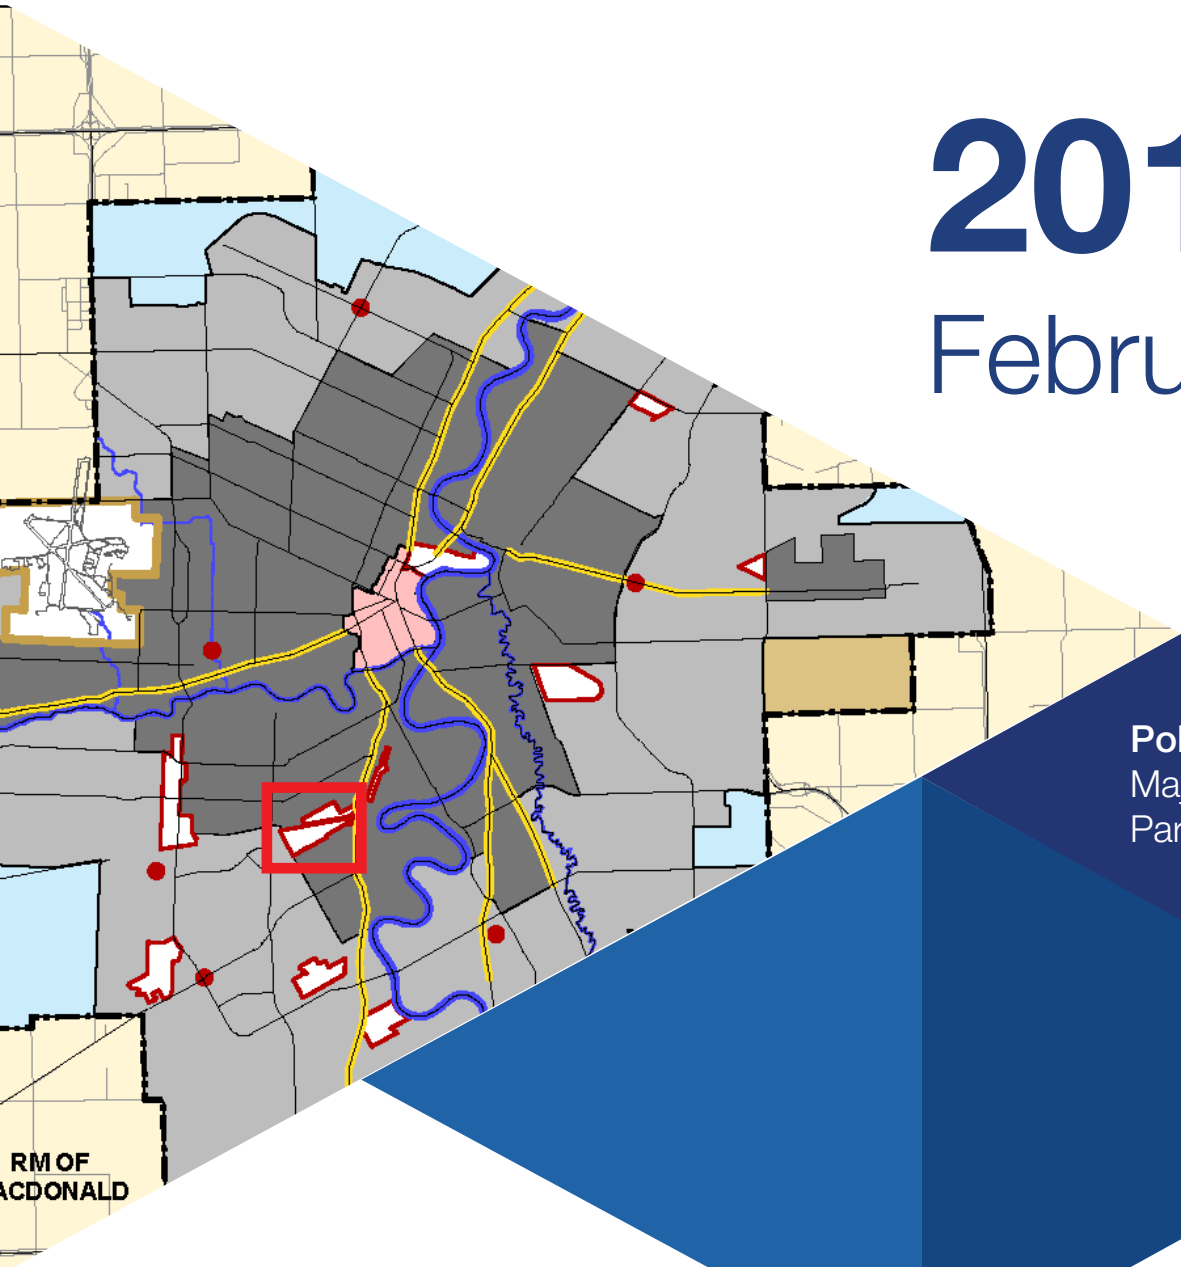

- Parker Avenue still connects directly through to Pembina at this time;
- Homes on the north side of Parker Avenue are starting to fill in;
- The barn at 1164 Parker Avenue is now gone;
- The storage/marshalling yards on the east side of the Parker Lands have now been removed (only see remnants of paths);
- Hydro lines are seen crossing through the Parker Lands property from north of the tracks; there also appear to be more towers and lines in the current hydro corridor that runs east-west (just north of Parker Avenue);
- There are still approximately 8 marshalling lines and two travel tracks to the north of the site;
- The ground in the central part of the site still looks fairly level and flat;
- There is a very wide clearing of a path (approx. 50') through the forest running north-south where the water main line currently exists. It appears that some type of live stock is also present along the central part of this path;
- A clear diagonal pathway can still be observed through the forest to the west;
- There is now a distinct access road (for rail?) on the west edge of the property;
- Waverley St. has been opened as the main north-south connector through the neighbourhoods;
- There is forest to the west of the CN access road where current Humane Society exists;
- The forest to the east of the site is quite pronounced (current day oak trees north of Heatherdale).
- First appearance of the reservoirs to the east of Waverley and south of Hurst Way.

1977 Aerial Photo from National Earth Observation Data Framework, Govt. of Canada

Observations

- There are several more rail lines to the north of the Parker Lands property than existed in the 1920's and 30's. There appear to be 8 marshalling tracks for rail car storage as well as 2 active tracks to the south of those and closest to the Parker property;
- There looks to be a fairly dense forest in the location to the west of Parker Lands where the current day storage facility is located – to the north of the Humane Society;
- There is no development on west side of Waverley Street at this time. Just a few years later Linden Woods was developed;
- Parker Avenue still extended east to Pembina but no longer connected directly through. It terminated in a roundabout just before reaching Pembina Highway;
- Parker also no longer continues directly west but rather turns to the north and links up with Hurst Way;
- Many pedestrian paths are evident throughout the entire forest to the west. There is still as strong north-south path on the western side of the site, likely to provide access to where a water main exists.

Executive Summary 1

1.0 Sequence and Summary - Policy Decisions 2

1.1 Pre Our Winnipeg 2

1.2 Our Winnipeg 5

1.3 Post Our Winnipeg 8

2.0 Conclusion 13

Executive Summary

This report sets out the series of City of Winnipeg policy decisions that inform development expectations for the Major Redevelopment Site known as the Parker Lands.

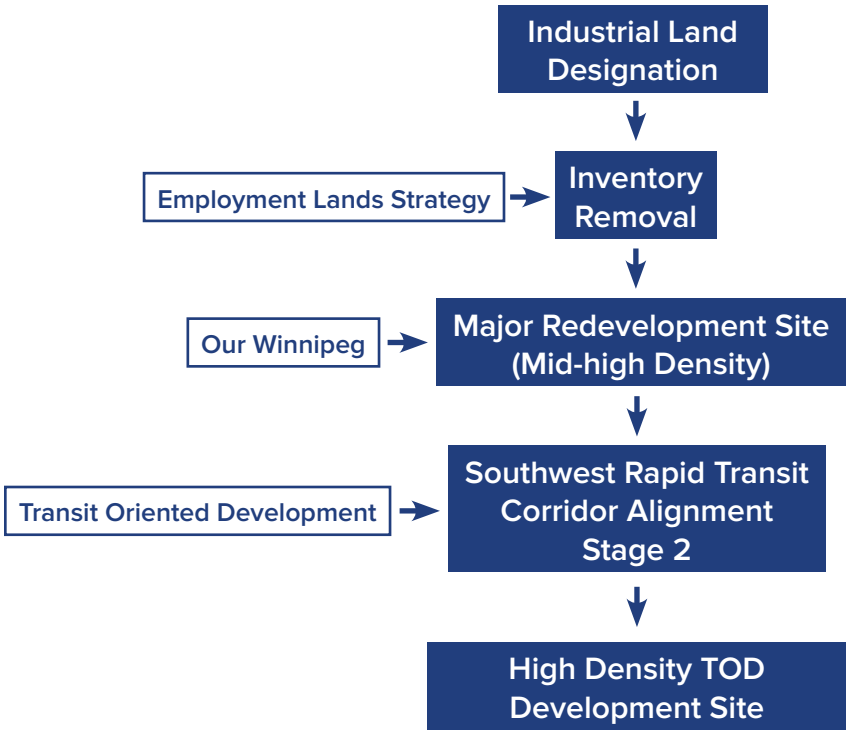

Specifically, it looks at the lead up to *Our Winnipeg*; the *Our Winnipeg* plan, the decision to designate the Parker Lands as a Major Redevelopment Site and subsequent decisions to support further densification of the site, including realignment of the Southwest Rapid Transit Corridor Stage 2 through the site.

The report concludes that the Parker Lands have been slated for redevelopment and re-purposing from an industrial land designation to a mid-high density mixed use site since 2007.

Since 2007, a progression of key policy decisions regarding the Parker Lands have occurred:

- Removal from the Industrial Lands inventory – *Employment Lands Strategy*
- Designation as high density mixed use to accommodate growth – *Our Winnipeg*
- Realignment of Southwest Rapid Transit Corridor Alignment Stage 2 through the Parker Lands and an increase in density targets (*Transit Oriented Development*)

With each policy decision, the City of Winnipeg reinforced its expectation that the Parker Lands – Major Redevelopment Site G be developed as high density mixed use.

1.0 Sequence Summary - Policy Decisions

1.1 Pre- Our Winnipeg

In the lead up to the Our Winnipeg plan the city commissioned three critical studies including the Conference Board of Canada 2007 Population Forecast, the Comprehensive Employment Lands Strategy and the Residential Land and Infill Strategy. These three studies initiated the City dialogue around how growth moving forward would be accommodated; the use of old industrial sites to accommodate growth and finally, the type and character of that growth as high density Major Redevelopment Sites.

These three studies would inform the policy foundation for the Our Winnipeg – Complete Communities plan.

1.1.1 Conference Board of Canada Population Forecast (2007)

The Conference Board of Canada was commissioned to forecast growth for the City of Winnipeg from 2007 to 2031. It predicted that that Winnipeg would grow by 188,000 people and 87,000 housing units between 2008 to 2031 or 3800 units per year. It predicted an annual growth rate between 1.5% and 1.9% or approximately 7520 people per year.

Winnipeg's Population Growth (*Our Winnipeg*)

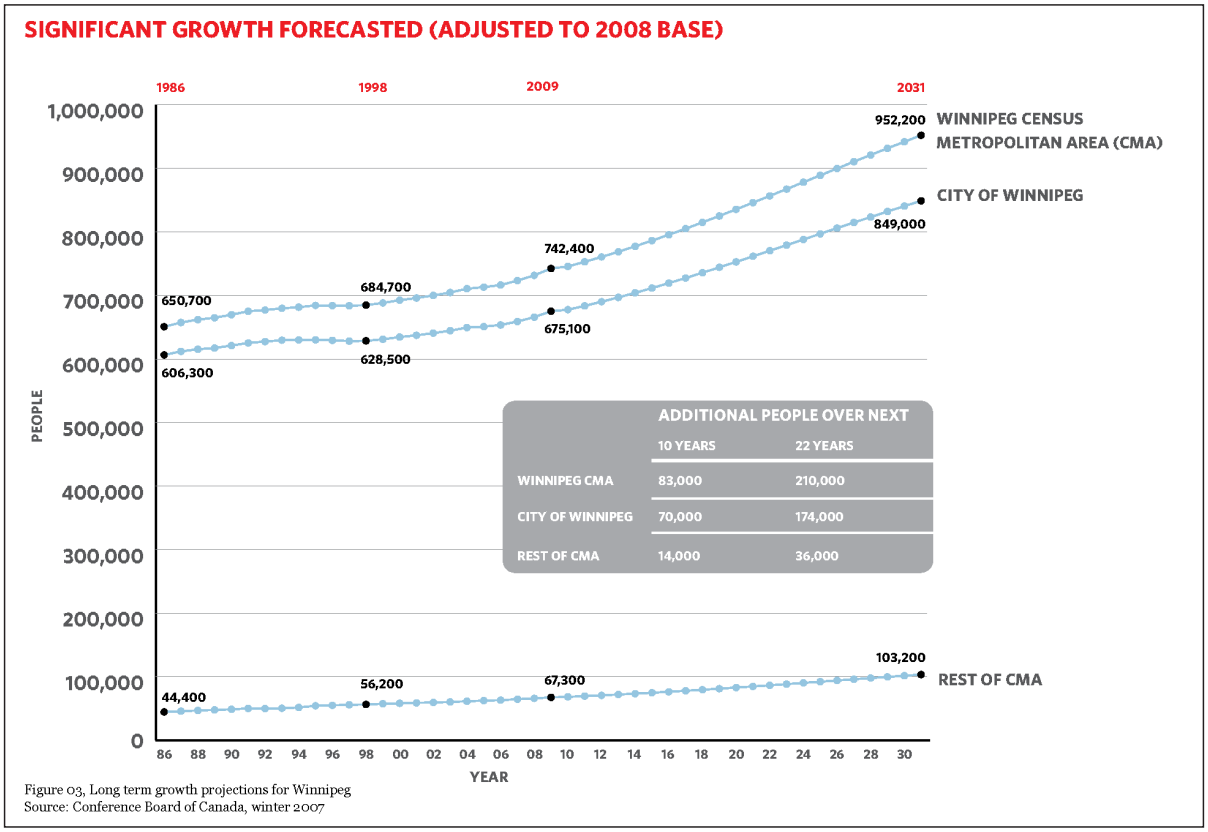

Figure 03, Long term growth projections for Winnipeg
Source: Conference Board of Canada, winter 2007

The Conference Board of Canada forecast was used as the basis for a thorough review of the City's existing land use supplies and how well existing supplies were positioned to accommodate demand. Both studies recommended significant and fundamental shifts to how growth and demand should be accommodated in the City of Winnipeg moving forward.

1.1.2 Winnipeg Employment Lands Strategy (2008)

In 2007, the City of Winnipeg retained the Altus Group – Economists to review the City's Industrial Lands Supply. The City's Employment Lands Strategy (2008) provided the foundation for the OurWinnipeg plan. It set out a robust vision to accommodate Winnipeg's changing economy. It looked at the City's growing sectors and identified land that best aligned with those sectors. It also looked at areas within the City's industrial land supply that weren't functioning or were considered obsolete and recommended that they be removed and repurposed for a higher and better use.

The strategy looked at all industrial lands against a set of criteria including: access, utilities, regulation, adjacent uses, amenities, and links to industry, site configuration and size. It identified the Parker Lands as unsuitable for industrial development for the following reasons:

- Transected by major hydro utility corridor making it difficult to develop for industrial purposes
- Major transportation access issues
- Requiring major infrastructure improvements including sewer separation that could best be accommodated through redevelopment to another use
- Adjacency to existing neighbourhoods.

The strategy recommended that the Parker Lands be removed from the industrial inventory and be designated for 'neighbourhood development'.

Parker Lands Policy Direction (*City of Winnipeg Comprehensive Employment Lands Strategy*)

> **Plan Winnipeg IPA Policy Recommendation:** It is recommended that the Parker Industrial Policy Area be redesignated to a Neighbourhood Policy Area in view of its unsuitability for development as employment lands due to servicing and access constraints.

1.1.3 Winnipeg Residential Land and Infill Strategy (2009)

The Winnipeg Residential Land and Infill Strategy (2009 – Office for Urbanism) looked at overall anticipated housing starts to 2031 based on projected growth and demographic change, using the Conference Board of Canada 2007 population forecast.

It assessed the current development patterns of the city and overall implications. It also looked at development capacity of range of land categories including greenfield, infill, redevelopment land and rural lands. It also reviewed and assessed industrial lands identified for removal in the Employment Lands Strategy, including the Parker Lands.

The Strategy identified the Parker Lands as critical supply if the City is to accommodate residential/mixed use growth within its urban boundary. It states that without considering other forms of development such as redevelopment sites and only relying on greenfield expansion (suburban areas), the City of Winnipeg will have insufficient capacity (15 years supply) to accommodate anticipated housing start activity to 2031.

The strategy further stated that even with build out of existing suburban areas, redevelopment sites such as Parker Lands at 25 du/acre (net), identified infill (only using vacant land) and assuming development of downtown surface parking lots (3,954 units), the City of Winnipeg would still only have 18.6 years of supply.

It further suggested that the Parker Lands site would be most efficiently developed to a mid/high net density scenario to justify infrastructure and transportation interventions.

The strategy concludes that the Parker Lands site is a critical input into the City of Winnipeg's growth forecast to 2031.

1.2 Our Winnipeg

The Our Winnipeg plan was drafted in 2009 and approved unanimously by City of Winnipeg Council in 2010.

The plan was a significant departure from all previous Plan Winnipeg versions. Up until Our Winnipeg, the City's official development plan focused almost entirely on accommodating suburban growth.

The Our Winnipeg plan and its companion direction strategies re-framed the previous focus on suburban growth to include directing growth to the existing city through redevelopment sites, infill, corridors and nodes. It strongly supports the redevelopment and densification of the Parker Lands. The Parker Lands were designated as one of eleven Major Redevelopment Sites.

Winnipeg's Urban Structure (*Complete Communities*)

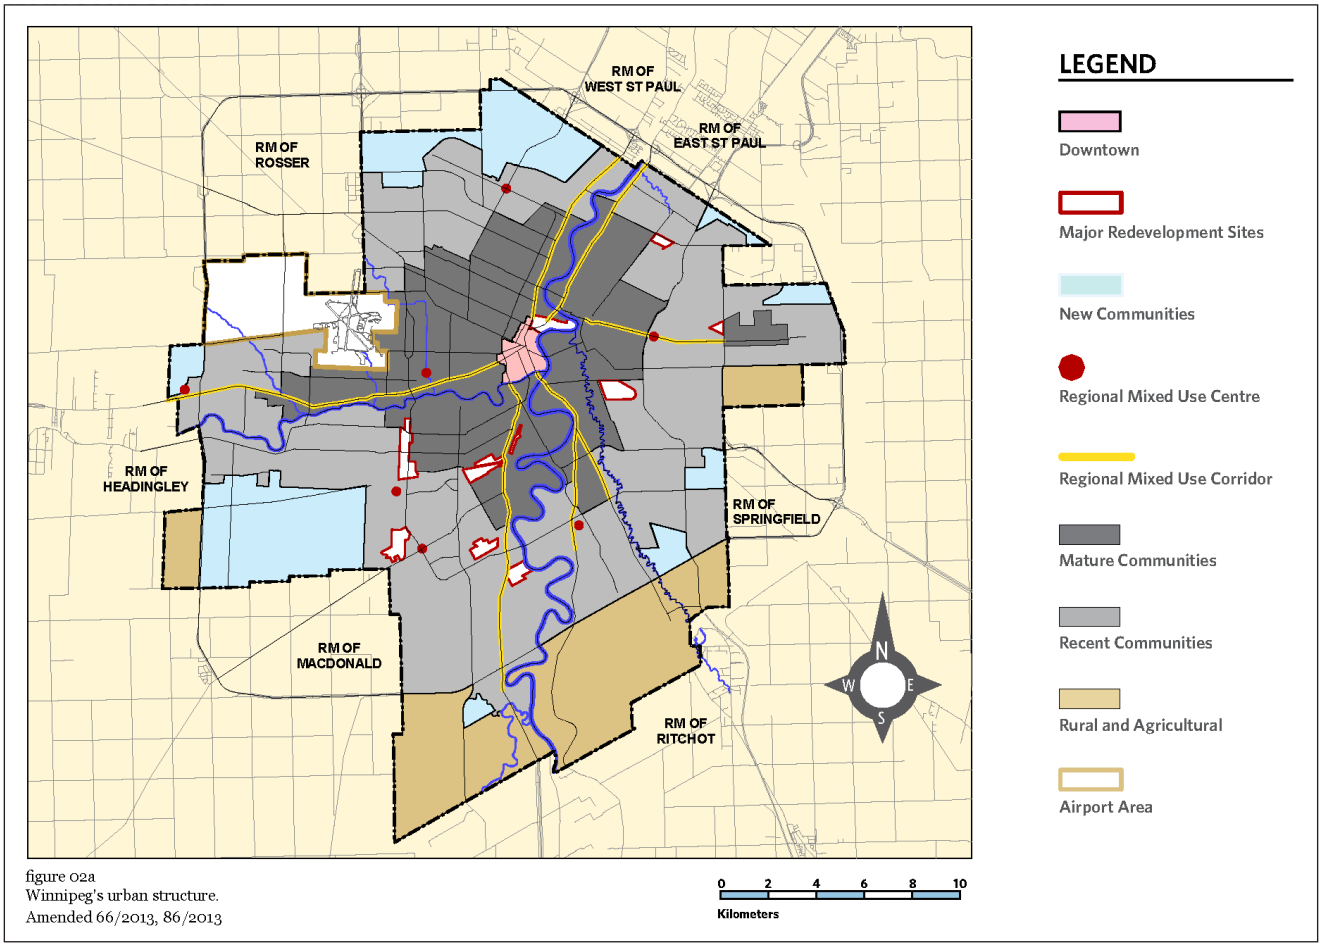

figure 02a
Winnipeg's urban structure.
Amended 66/2013, 86/2013

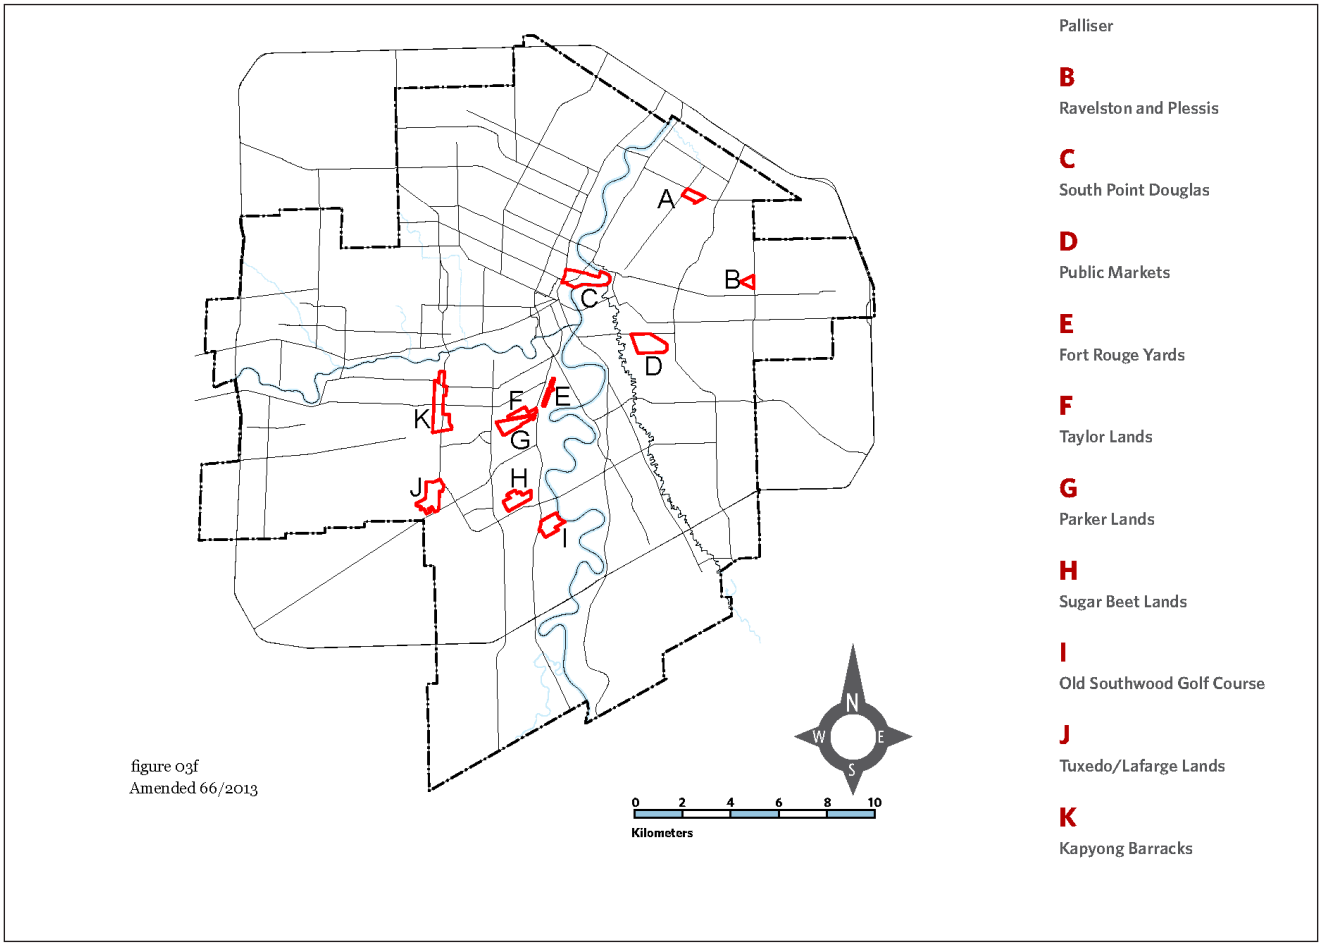

1.2.1 Complete Communities Direction Strategy

Our Winnipeg – Complete Communities Direction Strategy was based on the Conference Board of Canada 2007 population forecast, the Employment Lands Strategy (2008) and the Residential Land and Infill Strategy (2009). It was also informed through robust engagement with the community and stakeholders including the Winnipeg development industry.

It directs the City to support redevelopment and densification of The Parker Lands as Major Redevelopment Site – G. The Our Winnipeg plan identifies each of Major Redevelopment Site as necessary 'supply' required to meet growth demand.

The plan states that Major Redevelopment Sites, including Site G - Parker Lands are to "provide for complete communities with significant levels of mixed use, high density development, with strong urban design and attractive parks, places and open spaces". (Section 3.04 – Major Redevelopment Sites: Complete Communities, page 69)

Major Redevelopment Sites (*Complete Communities*)

1.2.2 Sustainable Winnipeg Direction Strategy

Sustainability is an overarching aspiration of the OurWinnipeg plan. The Sustainable Winnipeg Direction Strategy encourages responsible growth, environmental stewardship to reduce greenhouse gas emissions.

1.2.3 Winnipeg Water and Waste Direction Strategy

The Sustainable Water and Waste Direction Strategy provides important policy and tools that could enable, under the right circumstances, the application of innovative practices that move away from traditional servicing requirements.

1.2.4 Winnipeg Sustainable Transportation Direction Strategy

The Winnipeg Sustainable Transportation Direction Strategy is the precursor to the City of Winnipeg Transportation Master Plan. It sets out that a transportation system must be dynamically integrated with land use and should be developed to minimize resource consumption by transportation.

1.3 Post Our Winnipeg

A series of policy decisions were approved by Council subsequent to the adoption of Our Winnipeg that further reinforce the City's expectation that the Parker Lands should be redeveloped to support significant levels of mixed use, high density development. Perhaps the most significant decision was the realignment of the Southwest Rapid Transit Corridor Stage 2 through the Parker Lands.

1.3.1 Conference Board of Canada 2012 Population Forecast Revision

Since Our Winnipeg – Complete Communities was adopted in 2010, the City of Winnipeg through its growth forecasts revised its 2009 forecast, predicting more growth. In fact, the Our Winnipeg population forecast, conducted by the Conference Board of Canada, projected that annual population growth over the period 2007 – 2031 will average 7,525 persons per year. In 2012, this forecast was adjusted to 9,000 persons per year.

1.3.2 Transportation Master Plan (Adopted by Winnipeg City Council – November 16th, 2011)

The Winnipeg Transportation Master Plan (TMP) was adopted after Our Winnipeg. It strongly reinforced the need for a greater proportion of the City's future growth to be allocated within the existing built boundary to reduce impact on existing roadway infrastructure and encourage other less harmful transportation choices to the automobile including active transportation and public transit.

The Plan provided a framework that guides how the Major Development Site will be developed to efficiently and effectively accommodate all transportation modes to improve access, movement and mobility.

The TMP states, "A key goal in Our Winnipeg is to accommodate a greater proportion of the City's future growth within the existing built boundary. This would be accomplished through redevelopment and intensification in the City's transit-supportive land use areas: the downtown, mixed-use centres, mixed-use corridors, and major redevelopment sites." (Section 4 Integrating Transportation and Land Use; Winnipeg Transportation Master Plan, page 30)

The Transportation Master Plan further clarified the specific importance of the Parker Lands Major Redevelopment Site by introducing a possible Southwest Rapid Transit Corridor alignment concept that runs through the site.

1.3.3 Winnipeg Transit Oriented Development Handbook (TOD Handbook) (Adopted by Winnipeg City Council – Feb 22nd, 2012)

The Winnipeg Transit Oriented Development Handbook (TOD Handbook) was endorsed as policy (TR-006) by Winnipeg Council on February 22, 2012. It is the most definitive and establishes the following definition:

> "Moderate to higher density compact mixed-use development, located within an easy five to ten minute (approximately 400m to 800m) walk of a major transit stop. TOD involves high quality urban development with a mix of residential, employment and shopping opportunities, designed in a pedestrian oriented manner without excluding the automobile. TOD can be new construction or redevelopment of one or more buildings whose design and orientation facilitate the use of convenient and sustainable modes of transportation, including public transit and Active Transportation."
>
> - (Section 2A - TOD Defined; TOD Handbook, pg 6)

The TOD Handbook identifies the Parker Lands as fitting the TOD Urban Neighbourhood Typology:

Density

- 99 - 247 units per net hectare (40 - 100 units per net acre) enabled by:
  - Height: 3 - 12 storey buildings.
  - Site Coverage: 80% min - 90% max.

Pedestrian Environment

- 4.25 - 5.5 metres (14 - 18 feet) wide sidewalks (typ.), convenient connections, and other amenities.

Land Use Mix

- **Employment**: Office centre, retail, commercial, and urban entertainment. Primarily local serving retail; need for some community-serving retail.
- **Residential**: Mid-rise residential, condos, ground-related units, and mixed-use structures, with ground floor retail or office use required. Minimum ground floor height of 4.8 metres (16').

Transit Frequency

- 5-15 minutes.

Urban Neighbourhood Typology (*TOD Handbook*)

Implementation of TOD

Urban Neighbourhood

Density
99 - 247 units per net hectare (40 - 100 units per net acre) enabled by:
Height: 3 - 12 storey buildings
Site Coverage: 80% min.- 90% max.

Pedestrian Environment
4.25 - 5.5 metres (14 - 18 feet) wide sidewalks (typ.), convenient connections, and other amenities.

Land Use Mix
Employment: Office centre, retail, commercial, and urban entertainment. Primarily local-serving retail; need for some community-serving retail.

Residential: Mid-rise residential, condos, ground-related units, and mixed-use structures, with ground floor retail or office use required. Minimum ground floor height of 4.8 metres (16').

Transit Frequency
5-15 minutes.

1 High density: Predominantly residential district with a diversity in housing types. Good access to other regional and subregional centres.

2 A mix of uses: Horizontal and vertical mixed-use helps create an 18 hour activity zone. Retail spaces should articulate corners to help define a comfortable pedestrian zone.

4 Active defined centre: Public amenities creates a dynamic area for a variety of users. Art installations, farmer's market and programmed events activate these spaces all year around.

5 Innovative parking strategies: On-street parking, minimum surface parking, and some structured parking integrated into development.

41

1.3.4 Southwest Rapid Transit Corridor Stage 2 – Alignment Study – January 2013

The City of Winnipeg commissioned an alignment study to review the Southwest Rapid Transit Corridor Alignment as described in Our Winnipeg. It looked at a series of alignment options and concluded that the Our Winnipeg alignment be rerouted through the Parker Lands to maximize growth and densification opportunity.

The study focused largely on Our Winnipeg – Complete Communities directive and the Transit Oriented Development Handbook to use rapid transit to maximize development potential of Major Redevelopment Sites:

"In order to maximize the development potential of both the Major Redevelopment Sites and the viability of the transit system, these lands should be developed in accordance with the principles of Transit Oriented Development." (Complete Communities, p.66)

"Redevelopment Sites feature Neighbourhood Centres, including Parks, Places, and Open Spaces, that are the nodes with which to integrate public transit stations. The City's policy is to help reduce Major Redevelopment Site barriers related to the complexity of location, infrastructure, land assembly, and potential contamination."

The study went on to build the case that development of Major Redevelopment Sites along the corridor, including the Parker Lands MRS should be maximized to finance the rapid transit system:

"The potential for new development adjacent to the transit corridor creates a possible option to finance the transit project through a tax increment financing model. Both the current tax base for those areas with potential for TOD, and the future potential tax base resulting from projected TOD have been quantified. The differential represents the potential incremental tax revenues that could be utilized for project financing." (Southwest Rapid Transit Stage 2 Alignment Study – Final Report, Page 34)

1.3.5 City of Winnipeg Housing Policy – Endorsed by Winnipeg City Council – September 25th, 2013

City of Winnipeg's Housing Policy (ED-006) was endorsed by Winnipeg Council on September 25, 2013. The purpose of the Winnipeg Housing Policy is to support the implementation of OurWinnipeg and Complete Communities to achieve a sustainable and healthy housing environment that meets the needs of the Winnipeg population.

The City of Winnipeg Housing Policy is focused on key areas within the jurisdiction of the City of Winnipeg, and provides a leadership role to help strengthen policies and programs of other levels of government to ensure they support needs of the Winnipeg population. The City of Winnipeg Housing Policy forms an integral part of the overall policy framework and by-laws relevant to housing in Winnipeg. The City of Winnipeg's Housing Policy is aligned around four major priorities:

1. **Targeted Housing Development** – The objective is to encourage new housing development that promotes and supports City of Winnipeg policy goals. Including affordable housing, diverse housing options, universal design, and appropriate density to support infrastructure and creates complete communities.

1. **Neighbourhood Revitalization** - Support for revitalization and maintenance of existing housing that promotes adequate, safe living conditions for homeowners and tenants, and supports safe, orderly, viable and sustainable communities which brings new life back to Mature Communities.

1. **Building Community Capacity** - Enable communities to develop and implement locally planned, community supported housing renewal initiatives that are consistent with

OurWinnipeg and Complete Communities.

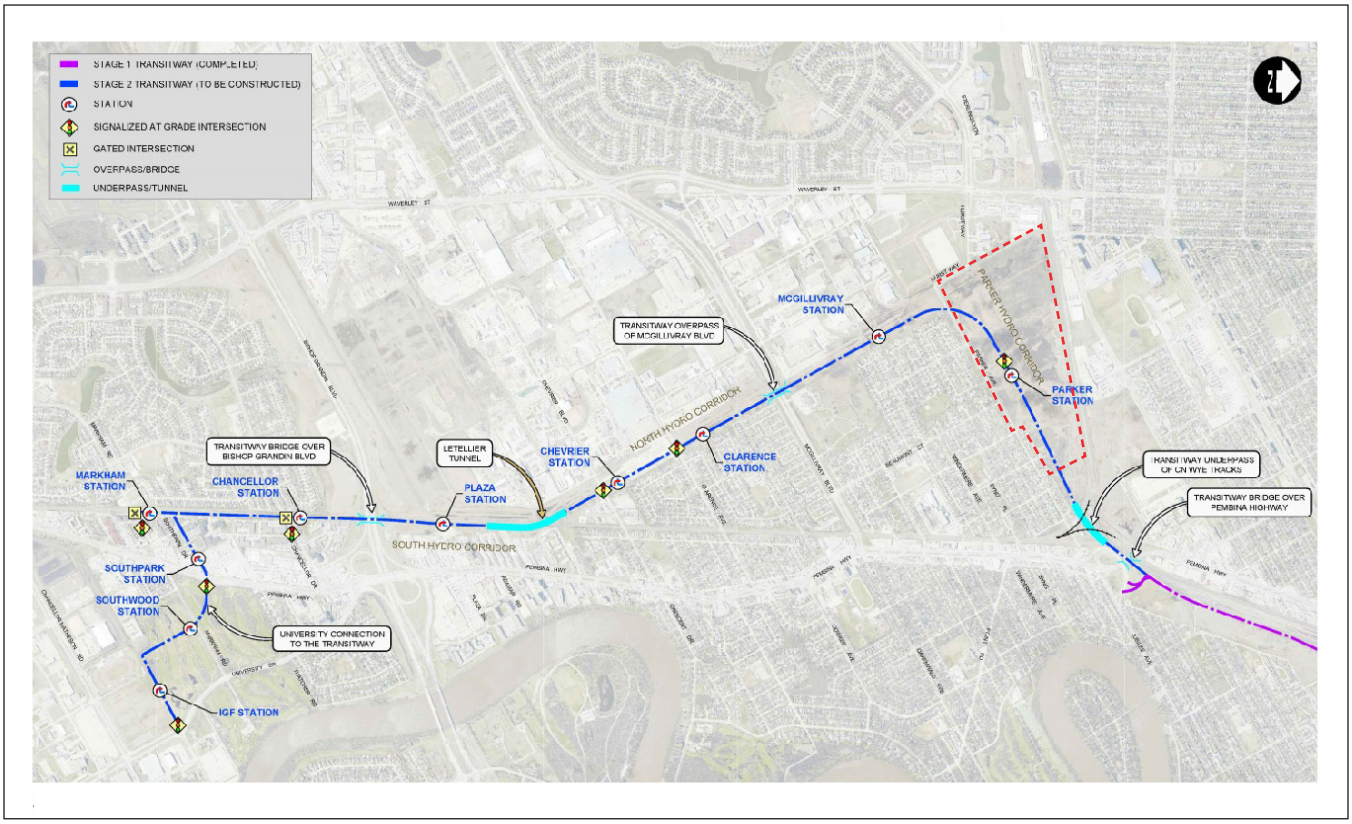

1. **Building Partnerships** - Establish the framework for complementary programs, tools, resources, and partnerships, including collaboration with other levels of government to meet the housing needs of the population of Winnipeg.

1.3.6 Re-alignment of SWRTC Stage 2 through the Parker Lands Major Redevelopment Site – Stage 2 – Approved by Winnipeg City Council – June 25th, 2014

Winnipeg City Council approved the realignment of SWRTC Stage 2 through the Parker Lands Major Redevelopment Site on June 25th, 2014. Council, in their decision, cited the imperative to align rapid transit to Major Redevelopment Sites, including Parker Lands, to maximize opportunity afforded through Transit Oriented Development.

"Following an alignment study in 2012, Council approved an alignment for Stage 2 of the Southwest Transitway through the Parker Lands, along a Manitoba Hydro corridor and then along the CN Letellier Subdivision south of Chevrier. Stage 2 will connect the existing Stage 1 (which currently ends at Pembina & Jubilee) to the University of Manitoba at Southpark" (Winnipeg City Council Minutes – June 25th, 2014)

Southwest Rapid Transit Corridor Stage 2 (*Dillon Consulting*)

2.0 Conclusion

In conclusion, this report demonstrates that the Parker Lands have been slated for redevelopment and repurposing from an Industrial Land Designation to a mid-high density mixed use site since 2007.

Since 2007, a progression of key policy decisions has occurred:

- Removal from the Industrial Lands inventory – Employment Lands Strategy
- Designation as high density mixed use to accommodate growth – Our Winnipeg
- Realignment of Southwest Rapid Transit Corridor Alignment Stage 2 through the Parker Lands and an increase in density targets – Transit Oriented Development

With each policy decision, the City of Winnipeg reinforced its expectation that the Parker Lands – Major Redevelopment Site G be developed as high density mixed use.

Gem Equities
33 Hargrave Street
Winnipeg, MB R3C 3T9

Attention: Andrew Marquess

Reference: Environmental Risk Management Strategy, Parcel B Plan 19317 WLTO, Winnipeg, Manitoba

Dear Mr. Marquess,

Dillon Consulting (Dillon) was retained by Gem Equities Inc. (GEM) to provide recommendations for a preliminary environmental risk management strategy (ERMS) for the property located at Parcel B, Plan 10317 WLTO, Winnipeg, Manitoba (the Site).

Background

The subject site is located adjacent to an existing railway corridor located within the City of Winnipeg. It is apparent that the rail line has been active for many years and therefore, there is potential for current or historic environmental impacts associated with typical railway operations.

Following a typical environmental site assessment (ESA) approach for this Site, a Phase I ESA would likely flag the potential for impacts resulting from the adjacent railway corridor and therefore recommend a future Phase II ESA. The type of impacts associated with former rail operations tend to be metals, and sometimes coal related material, found in the surficial fill material. Also, the fill material itself may have had contained metal impacts related to other industrial operations (ex. slag).

A Site Characterization work program (analogous to a Phase II ESA) would normally be conducted as part of the overall re-development for the site. The results of the Site Characterization would be used in the development of an environmental risk management strategy as further described below.

Environmental Risk Management Strategy

As indicated, a potential environmental concern related to the Site is the presence of historic impacts related to former railway operations. From a risk assessment perspective the exposure pathway that could pose a concern for these types of impacts is through direct contact (i.e. incidental soil ingestion or dust inhalation). An effective way to manage this risk is to eliminate the availability of the soil at the ground surface so there is no opportunity to release impacted material through dust generation – this can be accomplished through creating a ground surface cover, or cap, that acts as a separation barrier encapsulating the material below the surface where it does not pose an exposure risk.

During a typical re-development project such as the one contemplated for the Site, it is possible to incorporate a risk–management approach such as surface ground cover, or cap, as part of the overall grading design. This has been demonstrated as a cost-effective approach and has been applied to numerous industrial properties including former rail operations sites. *It should be stated that GEM and Dillon are using this technique on another similar development property in Ft. Rouge and Manitoba Conservation has accepted this strategy as an effective way to manage exposure risk related to surficial soil impacts.*

Given the above considerations, it is Dillon's professional opinion that the concern related to the former rail operation, specifically those associated with direct contact pathways, can be effectively managed as part of the re-development. If other environmental impacts are identified during the re-development, a risk management or remedial plan will be developed to mitigate potential exposure issues. Further, a Phase II ESA is not required at this time; rather it should be done in conjunction with the re-development and the risk management or remedial plan.

Closure

This report was prepared exclusively for the purposes, project and site location(s) outlined in the report. The report is based on information provided to, or obtained by Dillon Consulting Limited ("Dillon") as indicated in the report, and applies solely to site conditions existing at the time of the site investigation(s). Although a reasonable investigation was conducted by Dillon, Dillon's investigation was by no means exhaustive and cannot be construed as a certification of the absence of any contaminants from the site(s). Rather, Dillon's report represents a reasonable review

of available information within an agreed work scope, schedule and budget. It is therefore possible that currently unrecognized contamination or potentially hazardous materials may exist at the site(s), and that the levels of contamination or hazardous materials may vary across the site(s). Further review and updating of the report may be required as local and site conditions, and the regulatory and planning frameworks, change over time.

This report was prepared by Dillon for the sole benefit of our Client and their financial institution First National Financial. The material in the report reflects Dillon's judgment in light of the information available to Dillon at the time of preparation. Any use which a third party (i.e. a party other than our Client) makes of this report, or any reliance on or decisions made based on it, are the responsibilities of such third parties. Dillon accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

We thank you for the opportunity to be of service. Should you have any questions regarding the information or opinions expressed in this report please contact Mr. Doug Bell, M.Sc., P. Geo. at Dillon Consulting.

Sincerely,

DILLON CONSULTING LIMITED

Doug Bell, M.Sc., P.Geo.

APPENDICES

Appendix A: Report Mapping……22

1 INTRODUCTION

The land owned by 6165347 Manitoba Inc. and 7138793 Manitoba Ltd. within the Parker Lands Major Redevelopment Site is slated to undergo clearing with plans to develop the property into a transit-oriented residential community development project (TOD). To adhere to environmental protection requirements under the Federal Migratory Birds Convention Act (1994); the Manitoba Endangered Species and Ecosystem Protection Act (2015); and the Species at Risk Act, 2002 (Canada) prior to any clearing activities, the site was investigated for bird species at risk and breeding bird active nesting sites. This Pre-Clearing Breeding Bird Survey Report outlines the methods used for the Pre-Clearing Breeding Bird Survey work performed as well as the results of the survey. Based on the survey results, ecological recommendations are offered, including seasonal timing windows and setback distances for clearing activities around active nest sites.

2 PRE-CLEARING SURVEY METHODS

2.1 Survey Footprint Area

The Pre-Clearing Breeding Bird Survey Footprint Area encompassed the 6165347 Manitoba Inc. and 7138793 Manitoba Ltd. development property located within the Parker Lands Major Re-Development site. The Survey Footprint Area covers an area approximately 19.22 ha in size (Map 1), of which, 10.39 hectares is comprised of Aspen/Oak habitat, 3.44 hectares is comprised of grasslands, and 5.40 hectares is comprised of wetland habitats (EcoLogic, 2016). The Survey Footprint Area is located within an urban matrix, situated: to the south of the CN railroad line that runs parallel to Taylor Avenue; to the east of the Winnipeg Humane Society property; and to the north of the future City of Winnipeg Bus Rapid Transit Corridor and existing Manitoba Hydro transmission line corridor. Construction activities are currently underway on the lands adjacent to the Survey Footprint Area. The construction related activities include those associated with the City of Winnipeg Southwest Rapid Transit Corridor Project (Stage 2), the Parker Storm Retention Basin, as well as the Waverley Underpass Project.

2.2 Bird Species of Conservation Concern

Under the Federal Species at Risk Act (2002) and the Manitoba Endangered Species and Ecosystem Protection Act (2015), all bird species that are listed under these acts are protected by regulation. A listed bird species refers to species that has been identified as a species at risk, meaning a species that may be ranked as extirpated, endangered, threatened, or of special concern. For listed bird species, no person(s) shall damage or destroy the residence of one or more individuals of a wildlife species that is listed. In Manitoba, detailed records on provincial bird species at risk, together with their known locations, are maintained by the Manitoba Conservation Data Center (MBCDC). The MBCDC ranks species according to their abundance and on the basis of their range-wide (global - G) status, and their province-wide (subnational - S) status according to a standardized procedure used by all Conservation Data Centres and Natural Heritage Programs. Prior to conducting the Pre-Clearing Breeding Bird Survey, biologists recorded all bird

species that are listed federally, provincially, or ranked as an S2 species or above by MBCDC. Table 1 presents the birds listed federally, provincially, and by MBCDC that may be potentially found within the Survey Footprint Area.

Table 1: Bird Species of Conservation Concern Possibly Present within the Project Study Area

Common Name	Scientific Name	MESA Status	MBCDC (Aspen Parkland)	COSEWIC Status	SARA Status
Birds					
Baird's Sparrow	*Ammodramus bairdii*	Endangered	S1B	Special Concern	Special Concern
Bank Swallow	Riparia riparia	Not Listed	S4B	Threatened	Not Listed
Barn Swallow	*Hirundo rustica*	Not Listed	S4B	Threatened	Not Listed
Bobolink	*Dolichonyx oryzivorus*	Not Listed	S4B	Threatened	Not Listed
Burrowing Owl	*Athene cunicularia*	Endangered	S1B	Endangered	Endangered
Canada Warbler	*Cardellina canadensis*	Threatened	S3B	Threatened	Threatened
Cattle Egret	*Bubulcus ibis*	Not Listed	S2B	Not Listed	Not Listed
Chestnut-collared Longspur	*Calcarius ornatus*	Endangered	S2B	Threatened	Threatened
Chimney Swift	*Chaetura pelagica*	Threatened	S2B	Threatened	Threatened
Common Nighthawk	*Chordeiles minor*	Threatened	S3B	Threatened	Threatened
Eastern Wood-Pewee	*Contopus virens*	Not Listed	S4B	Special Concern	Not Listed
Eskimo Curlew	*Numenius borealis*	Endangered	SNA	Endangered	Endangered
Ferruginous Hawk	*Buteo regalis*	Endangered	S1B	Threatened	Threatened
Golden-winged Warbler	*Vermivora chrysoptera*	Threatened	S3B	Threatened	Threatened
Lark Bunting	*Calamospiza melanocorys*	Not Listed	S1B	Threatened	Not Listed
Least Bittern	*Ixobrychus exilis*	Endangered	S2B	Threatened	Threatened
Loggerhead Shrike	*Lanius ludovicianus excubitorides*	Endangered	S1B	Threatened	Threatened
Olive-sided Flycatcher	*Contopus cooperi*	Threatened	S3B	Threatened	Threatened
Peregrine Falcon	*Falco peregrinus anatum/tundrius*	Endangered	S1B	Special Concern	Special Concern
Piping Plover	*Charadrius melodus*	Endangered	S1B	Endangered	Endangered
Red-headed Woodpecker	*Melanerpes erythrocephalus*	Threatened	S3B	Threatened	Threatened
Short-Eared Owl	*Asio flammeus*	Threatened	S2S3B	Special Concern	Special Concern
Sprague's Pipit	*Anthus spragueii*	Threatened	S2B	Threatened	Threatened
Trumpeter Swan	*Cygnus buccinator*	Endangered	S1B	Not Listed	Not Listed
Whip-poor-will	*Caprimulgus vociferus*	Threatened	Not Listed	Not Listed	Not Listed

Common Name	Scientific Name	MESA Status	MBCDC (Aspen Parkland)	COSEWIC Status	SARA Status
White-faced Ibis	*Plegadis chihi*	Not Listed	S1B	Not Listed	Not Listed
Yellow Rail	*Coturnicops noveboracensis*	Not Listed	S3B	Special Concern	Special Concern

Further, The Migratory Bird Convention Act (1994) of Canada is additional protection for migratory bird species, their eggs, and their nests (MBCA, 1994). In compliance with this Act, no migratory bird species listed under this Act may be captured, injured, taken or disturbed, or nests may be damaged, destroyed, removed, or disturbed (MBCA, 1994). Special attention was given during the survey to search for migratory bird nests, especially in the taller grasses in close proximity to wetland areas.

2.3 Pre-Clearing Survey Methods

In order to investigate for migratory and breeding bird nesting in areas that are designated for clearing, intensive non-intrusive pedestrian bird surveys were conducted on June 14, 19, 21st, 2017 within the Survey Footprint Area. The pedestrian surveys were designed to search for multi-generational stick nests, active nesting tree cavities, and active stick nests and eggs. The field team conducted on-the-ground searches for bird nests on standing or fallen trees, cavity trees or snags, observation of birds, as well as recorded all incidental sightings of wildlife.

Biologists walked systematic transects spaced 10 m apart over the entire Survey Footprint Area allowing for 100 percent land base coverage (Map 1). Biologists recorded all wildlife observations, including the presence of nesting birds (identified by observation and by behavioral clues such as alarm calls or adults carrying nesting material) and all audio calls of birds heard within the search area. Picture 1 represents biologists walking slowly along pre-determined transects within the Survey Footprint Area, searching for bird nests and signs of bird activity. Within the wet areas, the vegetation was investigated for breeding waterfowl and waterbirds.

Picture 1: Biologists walking pre-determined transects on Pre-Clearing Bird Survey

Any stick nests identified were closely evaluated in the field. Biologists recorded detailed information at locations where nests were identified including:

- bird species and behaviour observed (e.g., flushing from nest);
- the stage of development (i.e., nest construction stage, eggs including number, hatchlings, almost fledged);
- UTM coordinates; and
- Photographs.

2.4 Active Bird Nest Mitigation

In the event that an active nest is identified during the Pre-Clearing Breeding Bird Survey, appropriate mitigation measures based on Environment and Climate Change Canada's Risk Factors for Migratory Birds will be recommended (Environment Canada, 2017). These mitigation measures may include a site-specific restricted activity buffer, monitoring of the active nests to determine if disturbance is occurring (depending on species), and/or other methods based on site-specific circumstances (Environment Canada, 2017). A risk-based assessment will be completed for each active nest discovered and the size of the restricted activity buffer, seasonal timing windows, or other recommended mitigation measures will be influenced by the species sensitivity to disturbance and status of the bird species (Environment Canada, 2017).

If a bird species with a special conservation status is identified, with a federally or provincially recommended setback distance, a nest site-specific setback distance will be recommended based on seasonal timing windows and guidelines established by Manitoba Sustainable Development (MBSD, 2014). Table 2 highlights listed bird species including the seasonal timing windows and the recommended setback distances, based on available defensible industry and government documentation sources.

Table 2: Listed Bird Species within the Survey Footprint Area including Seasonal Timing Windows and Recommended Set-back Distances for Active Nests

Bird Species	Seasonal Timing Windows and Recommended Set-Back Distances	Set-Back Citation Source
Forest Bird SAR Species* (including bank swallow, barn swallow, Bobolink, Canada Warbler, Common Nighthawk, Eastern Whip-Poor-Will, Eastern Wood-Pewee, Golden-winged Warbler, Olive-sided Flycatcher, Red-headed Woodpecker)	Pre-construction bird and nest search surveys and construction timing adjustments if outside of established activity window (i.e. overall activity block should occur between April 1 to August 31). Bank Swallow: Setback distance of 50 – 300 m (depending on disturbance level) from May 15-July 31 from nesting colony to protect from habitat disturbance. Barn Swallow: Setback distance of 50 – 300 m (depending on disturbance level) from May 15-September 30 from nest colony to protect from habitat disturbance. Setback distances should be applied if the timing of construction activity overlaps with sensitive time periods for breeding. Established setback distances are: 300 m (May 20-July 31) for Canada warbler; 300 m (May 15 – July 15) for Golden winged warbler; 300 m (May 15-July 15) for Olive-sided flycatcher, 200 m (June 1-July 15) for Common nighthawk, 200 m (May 15-July 15) for Whip-poor-will, 100 m (May 20-July 10) for Rusty blackbirds; 200 m (May 15-July 15) red-headed woodpecker; and 30 m for other species deemed by SARA and MBESEA to not be species at risk. Any active nest should have a setback distance of 200m from April 1 to Aug 31. Construction activities during bird breeding and brood rearing months is restricted from April 1 to July 31. Night-time activities will be avoided during the nesting season in part to minimize disturbance to common nighthawk. Limited vegetation management activities between April 1 and July 31. If presence is confirmed, setback distance of 300 m from May 15-July 15 is recommended to protect from sensory disturbance during breeding season.	Bipole III Transmission Project Environmental Protection Plan 2011; Lake Winnipeg East System Improvement Transmission Project, Keeyask Transmission Project, Chapter 7 – Effects Assessment and Mitigation; Manitoba Conservation Forest Management Guidelines; Manitoba Conservation Data Centre 2013; Canadian Wildlife Service Petroleum Industry Activity Guidelines for Wildlife Species at Risk in the Prairie and Northern Region 2009; Government of Saskatchewan, Activity Restriction Guidelines for Sensitive Species 2015; Government of Alberta, Recommended Land Use Guidelines for Protection of Selected Wildlife Species 2011
Waterfowl including Trumpeter swan	Pre-construction bird and nest (cavity ie goleneys, mergansers, wooducks and ground nests, ie dabblers) search surveys and construction timing adjustments if required. Setback distance of 500 m from April 1 – July 31 for Trumpeter Swan nest site during low disturbance and up to 1000 m for high disturbance. Maintain buffer around larger freshwater wetlands (greater than 5 hectares) that are dominated by dense tall emergent vegetation, typically cattail (Typha spp.), and containing deeper open water areas.	Forest Management Guidelines for Wildlife in Manitoba 1989; Ontario Ministry of Natural Resources, Habitat Management Guidelines for Waterfowl in Ontario 1985.

Water Bird SAR Species* (including American White Pelican, Black-crowned Night Heron, Caspian Tern, Horned Grebe, Least Bittern, Piping plover, Yellow Rail)	Setback distance of: 400 m (May 15-July 31) for least bittern, 350 m (May 15-July 31) for yellow rail, from April 1-July 31. Maintain buffer around larger freshwater wetlands (greater than 5 hectares) that are dominated by dense tall emergent vegetation, typically cattail (Typha spp.), and containing deeper open water areas.	Bipole III Transmission Project Environmental Protection Plan 2011; Lake Winnipeg East System Improvement Transmission Project; Canadian Wildlife Service Petroleum Industry Activity Guidelines for Wildlife Species at Risk in the Prairie and Northern Region 2009; Manitoba Conservation Data Centre 2013; Keeyask Transmission Project, Chapter 7 – Effects Assessment and Mitigation

3 PRE-CLEARING SURVEY RESULTS

Pedestrian transect surveys were conducted on June 14, 19, and 21st, 2017 to investigate for migratory and breeding bird activity and nesting within the Survey Footprint Area. Table 3, Map 2 presents all of the birds seen and heard within the Survey Footprint area, the nests identified, as well as all incidental wildlife activity identified.

Table 3: Results from the Intensive Pedestrian Bird Survey on June 14, 2017 of the Pre-clearing Survey Area

Waypoint	Latitude	Longitude	Species	Point Type	Total Count

There were eight nests identified within the Survey Footprint Area during the Pre-Clearing Breeding Bird Surveys, of which only three were determined to be active nests. Picture 2 presents the stick nest identified at way point 20 and Picture 3 presents the stick nest identified at way point 34, both of these nests were determined to be Cooper's Hawk nests (one active and one inactive)

Picture 2: Inactive Cooper's Hawk Nest Identified during the Pre-Clearing Bird Survey on June 14, 2017, Waypoint Number: 20

Picture 3: Active Cooper's Hawk Nest Identified during the Pre-Clearing Bird Survey on June 14, 2017, Waypoint Number: 34

The stick nest located at waypoint 20 was determined to be inactive with the presence of un-disturbed fall leaves accumulated within the nest. The stick nest located at waypoint 34 was

determined to be an active Cooper's Hawk nest with one chick on the nest. The stick nests located at way point 20 and way point 34 are near identical in size, shape, and depth. Picture 5 presents an image taken of the active Cooper's Hawk nest at waypoint 34.

Picture 5: Active Cooper's Hawk Nest Identified during the Pre-Clearing Bird Survey on June 14, 2017, Waypoint Number: 34

At waypoint 113, located within the wetland areas in the northwest corner of the property, two red-winged black bird fledglings were identified. Picture 6 provides an image of one of the red-winged black bird fledglings observed at waypoint 113. Given the presence of the fledging's, biologists believe a red-winged black bird nest was located within the wetland area. However, a construction crews working on adjacent property had dumped a substantial amount of mud into the wetland, potentially covering the red-winged black bird nest. Picture 7 and 8 present images of neighbouring construction crews dumping mud into the wetland. Map 3 presents the location of the fledglings within the wetland in relation to the dumped mud.

Picture 6: Red-Winged Black Bird Fledgling Identified during the Pre-Clearing Bird Survey on June 19, 2017, Waypoint Number: 113

Picture 7 and 8: Construction Crews Dumping Mud into a Wetland within the Survey Footprint Area, Identified during the Pre-Clearing Bird Survey on June 19, 2017, Waypoint Number: 113

Another stick nest was identified at waypoint 116 but this nest was determined to be inactive with undisturbed fall leaves within the nest (Picture 9).

Picture 9: Inacitve Stick Nest Identified during the Pre-Clearing Bird Survey on June 21, 2017, Waypoint Number: 113

The last nest identified within the aspen/oak habitat was a small stick nest (Picture 10) that was identified at waypoint 118. This nest was determined to be inactive.

Picture 10: Small Stick Nest Identified during the Pre-Clearing Bird Survey on June 21, 2017, Waypoint Number: 118

Within the northeastern wetland and willow shrub habitat areas, biologists noted an increased level of song bird activity, including a diversity of warbler species. Biologists combed the wetland areas and tall grasses for waterfowl and migratory bird nests. Within the wetland vegetation, cattails and tall reeds there were four additional nests identified, of which, only one nest was active and no migratory bird nests were identified. At waypoint 121, biologists flushed a swamp sparrow off the nest, and four eggs were found within the active nest. Picture 11 provides an image of the active swamp sparrow nest with the four eggs contained within.

Picture 11: Small Active Swamp Sparrow Nest with Four Eggs Contained within Identified during the Pre-Clearing Bird Survey on June 21, 2017, Waypoint Number: 121

At waypoint 123, a small inactive nest was identified. Picture 12 provides an image of the inactive nest.

Picture 12: Small Inactive Nest Identified during the Pre-Clearing Bird Survey on June 21, 2017, Waypoint Number: 123

At waypoints 124 and 125, there were two inactive red-winged black bird nests identified. Pictures 13 and 14 provide images of the nests.

Picture 13 and 14: Inactive Red-winged Black Bird Nests Identified during the Pre-Clearing Bird Survey on June 21, 2017, Waypoint Number: 124 and 125

A swamp sparrow fledgling was also identified within the wetland vegetation at waypoint 126.

Biologists investigated the willow shrub habitat carefully, although this vegetation was extremely dense. No bird nests were identified within the willow shrub habitat.

All incidental wildlife observations made during the breeding bird surveys were also recorded and way pointed. Biologists noted an increase in the level of white-tailed deer activity in comparison to previous surveys they conducted during the spring and summer of 2016. Biologists suspect this is due to a combination of factors, including the recent restrictions made on dog walking within the area, as well as the likelihood that neighbouring construction activities surrounding the Survey Footprint Area have supressed white-tailed deer movement, consolidating deer within the Survey Footprint Area. Picture 15 presents one fawn that was identified during the breeding bird survey at waypoint 11. Racoon tracks were also identified during the surveys and are presented in Picture 16.

Picture 15: White-tailed Deer Fawn Located within the Survey Footprint Area, Waypoint 11

Picture 16: Raccon Tracks Located within the Survey Footprint Area, Waypoint 117

4 RECOMMENDATIONS

Based on the results identified during the Pre-Clearing Breeding Bird Survey, Biologists recommend the following mitigation measures be in place with respect to clearing:

- A 50m clearing restriction buffer be in place around the active Cooper's Hawk nest. This clearing buffer of 50m should remain in place until July 30th with biologists confirming that the chick has successfully fledged prior to the buffer removal. The 50m clearing restriction buffer was derived in consultation with MBCDC. Map 4 presents this activity restriction buffer around the active Cooper's Hawk nest.
- The wetlands with the red-winged black bird fledglings (located in the northwest corner of the Survey Footprint Area) has been filled in with mud by neighboring construction crews. Since the birds had fledged, and given the wetland is now buried under mud, we do not provide any activity restriction for this wetland.
- Biologist should check the active swamp sparrow nest to ensure the swamp sparrows have fledged prior to clearing.
- No migratory bird nests or species at risk nests were identified within the Survey Footprint Area requiring a clearing restriction buffer, therefore, outside of the 50m clearing restriction buffer in place around the Cooper's Hawk nest, over the remaining Survey Footprint Area, clearing can commence.

5 SUMMARY

The Pre-clearing Breeding Bird Survey conducted within the Survey Footprint Area was designed and executed to ensure compliance with all federal and provincial legislation. Based on the survey findings, ecological recommendations are offered. A setback distance of 50m around the active Cooper's Hawk nest is provided and should be adhered to until which time the chick within the nest has successfully fledged. Biologists should check the Cooper's Hawk nest again after July 31, 2017 to ensure the nest is empty and the area can be waived and clearing within the buffer can commence. No migratory bird or bird species at risk nests were identified within the Survey Footprint Area, therefore no further clearing activity restriction buffers are required.

1 INTRODUCTION

The land owned by 6165347 Manitoba Inc. and 7138793 Manitoba Ltd. within the Parker Lands Major Redevelopment Site is slated to undergo development of the property into a transit-oriented residential community development project (TOD) known as Fulton Grove.

A +/- 4-acre portion of aspen/oak vegetation is being considered to be maintained and integrated into the residential neighborhood as a community park greenspace. Several possible locations and polygon configurations of the remnant aspen/oak vegetation are options for this community park greenspace.

The determination of the best possible location and polygon configuration for the community park greenspace is based on a variety of factors. An aspect of consideration for the potential location of the community park greenspace, is the vegetation characteristics and the intended community park greenspace use.

As such, the current trail network and elevation associated with the various potential community park greenspace polygon options is presented. This includes an assessment of the present vegetation characteristics based on approximate tree age and greenspace polygon biodiversity, as well as an investigation of the presence of native species, invasive/non-native species, and noxious weed species.

Based on the Fulton Grove transit-oriented residential community development project planned within the Project Footprint Area and the likely intended use of the community park greenspace, forthcoming elevation variations and human impact within and around the retained greenspace are considered. These impeding dynamics are likely to translate into shifts in greenspace vegetation characteristics.

2 PROJECT FOOTPRINT AREA

The 6165347 Manitoba Inc. and 7138793 Manitoba Ltd. Fulton Grove development property located within the Parker Lands Major Re-Development site covers an area approximately 19.22 ha in size **(Appendix 1, Map 1)**. Prior to clearing activities, the Project Footprint Area **(Appendix 1, Map 1)** was comprised of 10.39 hectares of aspen/oak habitat, 3.44 hectares of grasslands, and 5.40 hectares of wetland habitats (EcoLogic, 2016). The Project Footprint Area is located within an urban matrix, situated: to the south of the CN railroad line that runs parallel to Taylor Avenue; to the east of the Winnipeg Humane Society property; and to the north of the future City of Winnipeg Bus Rapid Transit Corridor and existing Manitoba Hydro transmission line corridor. Construction activities are currently underway on the lands adjacent to the Project Footprint Area. The construction related activities include those associated with the City of Winnipeg Southwest Rapid Transit Corridor Project (Stage 2), the Parker Storm Retention Basin,

as well as the Waverley Underpass Project. In July and following in September 2017, portions of the Project Footprint Area were cleared with ongoing grading occurring in late October and November, 2017.

3 GREENSPACE CLASSIFICATION

In 2005, the City of Winnipeg surveyors ranked a portion of Project Footprint Area, aspen/oak vegetation as “A” grade quality, based on criteria used by the City of Winnipeg for the Ecologically Significant Natural Lands Strategy & Policy grading system (City of Winnipeg, 2007). The Grade “A” ranking of the aspen/oak habitat (**Appendix 1, Map 2**) remained categorized as such until 2015. In December of 2015, the City of Winnipeg provided the developer with a refinement of the total Grade A aspen/oak area with a tapered delineation of preferred aspen/oak habitat for potential retention within the Project Footprint Area (**Appendix 1, Map 2**).

In December of 2016 the City of Winnipeg provided the developer with a 1 to 10 grading system for parts of the Grade A aspen/oak forest, refining areas they classified as key habitats with their higher preference for community park greenspace retention. Delineated polygons allocated a 10 rank by the City of Winnipeg, represented the polygons considered to be of highest vegetation quality and highest preference for retention versus polygons ranked with 1, which were considered to be of the lowest vegetation quality and the lowest preference rank for greenspace retention (**Appendix 1, Map 2**). Based on these polygon rankings, the City of Winnipeg provided two possible overall +/- 4-acre areas of their highest preference for community park greenspace retention within the Project Footprint Area (**Appendix 1, Map 2**).

In May of 2017 (after the developers DASZ pre-application submission), the City of Winnipeg supplied the developer with another set of options (n=2) for preference for community park greenspace retention areas. The May 2017 polygons represented an overall area greater than the +/- 4 acres in order to offer the developer some leeway for the final community park greenspace retention area location. The City of Winnipeg May 2017 preference polygons did not directly align with the City of Winnipeg December 2016 1 to 10 grading system.

Based on the transit-oriented residential community development plans, the developer allocated and provided two preference areas for the community park greenspace area of which, the City of Winnipeg May 2017 preferred greenspace retention polygons did overlap in the southernmost option with the developers preferred community park greenspace location (**Appendix 1, Map 2**).

4 VEGETATION CHARACTERIZATION

Potential community park greenspace retention polygon areas were used for the vegetation characterization conducted on October 11 and 12, 2017. Each of the potential community park greenspace polygons is allocated a name identification for the vegetation characterization work (ranging from polygon A through polygon H). Based on the City of Winnipeg 1-10 ranking system, only polygons at either end of the 1-10 classification spectrum (polygons named 1, 2, 8, 9 and 10)

were assessed. **Table 1, Appendix 1, Map 3** represent the potential community park greenspace polygon name identification as well as the overall polygon size.

Table 1: Greenspace Polygon Name Identification and Size

Polygon Name Identification	Area (m²)
A	2187.94
B	3383.27
C	4014.87
D	2638.93
E	2316.03
F	5057
G	2629.85
H	2737.52

4.1 Trail Network

The Project Footprint Area has been heavily used by humans in the past with a matrix of human and dog walking trails that exist throughout the Project Footprint Area. Trails act as transportation networks for people and pets, as well as transportation vectors for invading plant species (Tyser & Worley 1992). As such, recreation trails, while offering human recreational enjoyment opportunities, also have the potential to significantly alter local vegetation and soil properties, and act as efficient networks for the introduction of exotic species into previously native vegetation areas (Adkison & Jackson 1996).

During the baseline environmental surveys conducted in June 2016, biologists walked existing trails throughout the Project Footprint Area, tracking their path on hand-held GPS units. Based on the path tracking data that were generated during field work in combination with publicly available trail data that was derived from satellite imagery, the trails within the Project Footprint Area were digitized and categorized. The trails were categorized into three categories: small trails (width of 0.75 m); medium trails (width of 1.5 m); and large trails (width of 3.0 m). To validate these categorizations of trail width, these trail widths were verified during the June 2016 field work with measurements taken to ensure width representations for each trail category were accurate (Ecologic, 2016).

In October 2017, each of the trail networks were spatially clipped in ArcGIS 10.3 to the potential community park greenspace polygons (**Appendix 1, Map 3**), to identify the amount of current trail within each potential greenspace polygon (**Table 2, Appendix 1, Map 4**).

Given the significant degree of past human influence along these trails, invasive and weedy species encroachment was favored, resulting in invasive species and non-native weed expansion along trail edges. The degree of spread of weedy and invasive species associated with each trail category were measured and quantified and also clipped to each potential greenspace polygon. The degree of weedy and invasive species encroachment on small trails was determined to be 0.5 m (for a total width of trail plus weedy buffer of 1.25 m); on medium trails was determined to be 1.0 m (for a total width of trail plus weedy buffer of 2.50 m); and on large trails was determined to be 2.0 m (for a total width of trail plus weedy buffer of 5.0 m).

Based on these quantifications, the total proportion of each potential greenspace polygon comprised of trail network and weedy and invasive species encroachment was calculated (**Table 2, Appendix 1, Map 4**).

Table 2: Amount of Footprint within each Potential Greenspace Polygon Lost to Trail Network and Weedy/Invasive Species Encroachment

Site	Area (m²)	Area of Trails (m²)	Proportion of Trails in Greenspace Polygon (%)	Area of Trails and Encroachment Area (m²)	Proportion of Trails and Encroachment (%)
A	2187.94	43.79	2.00%	72.94	3.33%
B	3383.27	171.18	5.06%	268.66	7.94%
C	4014.87	239.69	5.97%	409.41	10.20%
D	2638.93	27.02	1.02%	45.02	1.71%
E	2316.03	139.04	6.00%	263.37	11.37%
F	5057	334.47	6.61%	520.77	10.30%
G	2629.85	391.76	14.90%	594.18	22.59%
H	2737.52	81.79	2.99%	135.62	4.95%

The greenspace polygons currently with the highest percentage of trail network and invasive/weedy species encroachment are G, E, F, and C respectively. Each of these noted polygons represents an area of over 10.2% of the total potential greenspace polygon footprint lost to trail and the invasive/weedy encroachment associated with the trail network.

5 ELEVATION

The landscape grading of the Regional Parker Lands Major Redevelopment Area, including the CN railway, the commercial development of lands to the west, and the grading of the hydro corridor to the south, has resulted in water runoff from neighboring properties draining onto the Project Footprint Area resulting in standing/pooling water over large portions of the site. Some portions of the Project Footprint Area have more standing water than other portions, depending on the existing elevation. Over time, areas characterized by long-term standing water and/or

saturated soils yield shifts in vegetation species diversity favoring species that can tolerate saturated soils e.g. common buckthorn (*Rhamnus cathartica*) and deterring species requiring drier soils e.g. bur oak, (*Quercus macrocarpa)*.

AutoCAD files provided by the developer in March 2017 included elevation points for areas within and surrounding the potential greenspace polygons. Using the "create TIN" tool within the ArcGIS, a Triangular Irregular Network (TIN) was created using the elevation point data provided. The elevation points within the Project Footprint Area were used to create the TIN, visually displays the difference in elevation for each potential greenspace polygons, by creating a network of triangles between the neighboring elevation points. The triangles were merged generating polygons of similar elevation. The analysis results in a series of polygons representing the elevation for a given area, displayed using a self-determined color ramp (**Appendix 1, Map 5**). **Table 3, Appendix 1, Map 5** represent the elevation range for each potential greenspace polygon.

Table 3: Elevation Range of each Potential Greenspace Polygon

Site	Min elevation (m)	Min elevation (feet)	Max elevation (m)	Max elevation (feet)	Average elevation (m)	Average elevation (feet)
A	232.54	762.72	232.68	763.17	232.6	762.93
B	232.31	761.98	232.57	762.84	232.39	762.23
C	232.31	761.98	232.57	762.84	232.39	762.23
D	232.75	763.42	232.99	764.2	232.86	763.77
E	232.47	762.51	232.77	763.47	232.62	762.98
F	232.47	762.51	232.85	763.74	232.69	763.23
G	232.39	762.23	232.79	763.54	232.63	763.03
H	232.63	763.02	233.16	764.75	232.91	763.93

The potential community park greenspace polygons with the highest current elevation are polygons H, D, F, and G respectively. These polygons have been subject to less long-term water pooling and ground saturation in comparison to polygons characterized by lower elevation. Polygons with the current lowest elevation are C, B, and A. As a result of the Regional Parker Land Major Re-Development Area past drainage regimes, site areas characterized by lower elevation have been notably subject to vegetation diversity shifts, favoring species best able to tolerate saturated soils (e.g. common buckthorn).

6 FIELD SURVEY

6.1 Survey Methods

Field vegetation characterizations were undertaken to compare tree approximate age, the presence of native species, invasive/non-native species, and noxious weed species within the potential community park greenspace polygons. Adopting the survey methodologies of Redburn and Strong (2008), tree species and ages, shrub understory, and herb cover (where possible given survey seasonal timing) were recorded along transects. Given the survey seasonal timing occurring late within the growing season, determination of tree canopy % cover, shrub % cover and identification of complete ground herb layers were not possible.

For each of the potential community park greenspace polygons assessed, the centroid location of each polygon was determined using ArcGIS 10.3 (**Appendix 1, Map 6**). The centroid locations for each potential community park greenspace polygon were loaded into hand-held GPS units and were located during field work (**Appendix 1, Map 6**)**.** From the centroid location within each potential community park greenspace polygon, a transect of 15 m was surveyed on either side of the centroid for a total transect length of 30m. Once at the potential community park greenspace polygon centroid, a straight line transect was laid using a 30 m measuring tape. Transect locations and azimuths were recorded.

At each 5 m interval along the transect tape a 2.5 m x 2.5 m quadrat was used to identify shrubs 1 to 2 m tall (Redburn & Strong, 2008). The occurrence of native species and invasive/non-native plant species were noted where visible along the transect. No attempt was made to quantify herb species as many were senescent due to the change of season.

Further, for each 30 m transect, a second sample plot area was generated measuring 30 m (the full length of the transect) x 20 m wide rectangular sample plot. Within this larger sample plot trees > 2.5 m tall were identified and dominant and sub-dominant species were measured for diameter and age (where growth rings can be measured). Within the 30 m x 20 m sample plot, the largest tree of each tree species was measured for diameter as well as assessed for approximate age by collecting a sample using an increment borer (**Photograph 1**) and counting tree growth rings (Redburn & Strong, 2008). For consistency, the left side of each polygon transect was used for the 30 m x 20 m tree sampling plot (Redburn & Strong, 2008). Along each 30 m transect, a total of five shrub/understory survey quadrats and one tree sample plot were characterized (**Appendix 1, Map 7**).

Photo 1: (UTM Y 5523408.6 UTM X 631481.8) Example of the increment borer used to collect core sample for counting tree growth rings October 11, 2017

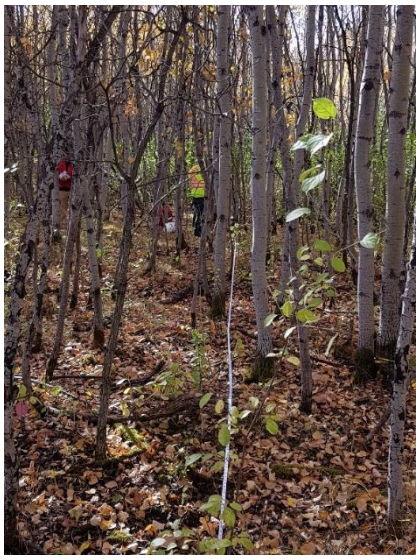

All data gathered along each transect were recorded on data sheets and later transferred into a database for analysis. **Appendix 2** provides an example of a completed field data sheet.

Photos 2, 3, 4: Example of transects used to collect shrub and understory vegeation within each potential greenspace polygon October 11, 2017

6.2 Survey Results

Within each potential community park greenspace polygon, a 30 m transect was used. **Table 4** provides the transect location and azimuth used within each potential community park greenspace polygon characterization.

Table 4: Transect location and Azimuth used for each Potential Greenspace Polygon Characterization

Site	Transect Azimuth (degrees)	Date Sampled
A	20	11-Oct
B	282	11-Oct
C	360	11-Oct
D	20	11-Oct
E	250	11-Oct
F	107	11-Oct
G	248	11-Oct
H	326	11-Oct

Appendix 1, Map 8 presents the locations of the sampled aspen and oak trees within each potential community park greenspace polygon option.

Based on all of the data collected, a master database was developed. These data are provided in **Appendix 3. Appendix 3** presents the native species, invasive and exotic species, the largest tree sampled age and diameter of the largest tree at breast height. A summary of these data is provided in **Table 5.**

One invasive species, common buckthorn, a species able to tolerate saturated soils, was present in several of the potential community park greenspace polygons characterized, and most predominately present in A, F, C, B. **Photograph 5** illustrates common buckthorn identified in polygon option B. Common buckthorn leaves come out early in spring and remain on the plant until late fall which shades out most native plants resulting in common buckthorn becoming the dominant vegetation species in areas where it presides (Tree Canada, 2017). Common buckthorn fruits, leaves, and bark are cathartic (purging) to most animals but birds eat them readily. Birds are largely responsible for the spread of common buckthorn since the seeds within the fruit pass through the bird without damage (Tree Canada, 2017).

In all polygons, trembling aspen *(Populus tremuloides*) was the dominant tree species. In several polygons, bur oak was present, most notably present in polygon options H, G, and F. Only in polygon option C was there the presence of young ash (*Fraxinus pennsylvanica*) trees (**Photograph 6**).

7 COMMUNITY PARK GREENSPACE OUTLOOK

Given the potential development of the Fulton Grove transit-oriented residential community, the site will be dominated by human land uses and human activity. The Fulton Grove community park greenspace will support human walking, dog walking, and potentially house a children's playground. The development of the Project Footprint Area in conjunction with adjacent construction and property development, variations in site elevation are anticipated. In light of these dynamics, shifts in current greenspace vegetation characteristics are anticipated to occur over time.

7.1 Greenspace Future Use & Vegetation Characteristics

Currently, aspen is the dominant tree species in all community park greenspace polygon options. The oldest aspen trees are located in polygons in the southern portion of the Project Footprint Area and the older oak are located in the northern portion of the Project Footprint Area. In several of the community park greenspace polygon options, common buckthorn presides. Only in one polygon, community park greenspace polygon option B was there the presence of young ash trees, a third tree species noted over and beyond aspen and oak. Polygons with higher elevation currently house more oak.

Past use of the Project Footprint Area as a recreational space for human and dog walking activities has led to the introduction of invasive/non-native vegetation species and bolstered their spread within the forested area of the site, reducing overall ecological integrity. Regardless of the community park greenspace location and polygon configuration, future use of the greenspace area for human and dog walking related activities will have an effect on invasive species dynamics along trail corridors and result in shifts in vegetation characteristics (Adkison & Jackson, 1996). Trail networks within the retained greenspace will result in soil erosion, soil compaction, and vegetation trampling by human and dog walking related activities (Adkison & Jackson, 1996).

Given the intended use of the retained greenspace is aimed to support local community member recreation by way of human and dog walking activities and potentially accommodate a children's playground, the overall ecological integrity of the retained greenspace polygon will be subject to impact and diminish in quality. In all polygon options, the retained greenspace site will be isolated, surrounded by residential homes, a road network, rapid transit way, and a railway and void of habitat connectivity. These factors in combination with human disturbance and human pressures will result in vegetation characteristics shifts and reduce the overall functionality of the site as favorable wildlife habitat.

7.2 Elevation

The Project Footprint Area is set to undergo potential transformation into a transit-oriented residential community. Consequently, the current elevation within the Project Footprint Area will change dramatically, in some areas up to 3 meters.

Further, the Regional Parker Lands Major Re-Development Area is presently undergoing development through a series of regional concurrent projects including the City of Winnipeg's Stage 2 Rapid Transit Corridor, the Waverly Street Underpass, as well as the Project Footprint Area residential development. Significant changes to the overall site topography are expected to occur including modification to the past drainage regimes. As regional elevation patterns are modified, over time, these elevation changes will result in changes to soil saturation levels and shifts within the vegetation community diversity.

8 SUMMARY

Several potential locations and polygon configurations are being considered for the Fulton Grove community park greenspace area. The decision of where the community park greenspace will be located is based on a number of factors. As an aspect of this consideration, vegetation characteristics were investigated including the current trail network, elevation, tree stand diversity, tree age, and the presence of invasive and non-native species within potential community park greenspace polygons.

Field investigations identified aspen trees as the dominant tree species in all potential greenspace polygon options with the oldest aspen trees located in the southerly portions of the Project Footprint Area. Common buckthorn, an aggressive invasive species, was prevalent in several of the greenspace polygon options, especially the southerly polygon options. This invasive species is able to thrive in saturated soils and may choke out other native vegetation reducing overall vegetation diversity in areas within which it is located. All possible community park greenspace polygons are characterized by past human trail networks with invasive/weedy species encroachment.

In all polygon options, the retained greenspace site will be isolated, surrounded by residential homes, a road network, rapid transit way, a railway and void of habitat connectivity. These factors in combination with human disturbance and human pressures will result in vegetation characteristics shifts and reduce the overall functionality of the site as favorable wildlife habitat. Resultantly, the site will undergo reduced biodiversity, invasive/non-native species introduction and spread, and lessened functionality of the site as suitable wildlife habitat.

Regardless of location or polygon configuration, given the intended use of the retained greenspace is aimed to support local community member recreation by way of human and dog walking activities and potentially accommodate a children's playground, the overall ecological integrity of the retained greenspace polygon will be subject to impact and diminish in quality.

EXECUTIVE SUMMARY

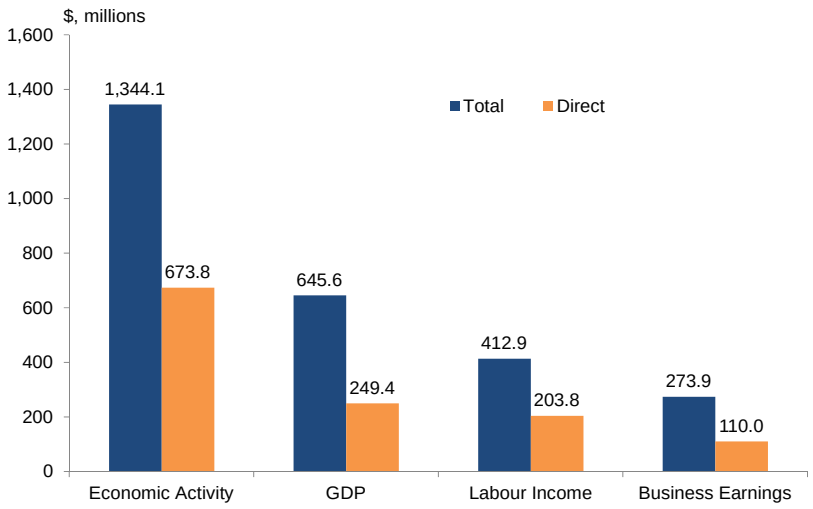

The construction of a new residential community on the Parker Lands in the City of Winnipeg will generate substantial economic benefits in terms of jobs, GDP, incomes and tax revenues for governments. In addition, it will bring a host of other benefits including revitalizing previously underutilized vacant lands in a manner consistent with the goals outlined in the OurWinnipeg development plan.

BENEFITS FROM CONSTRUCTION & DEVELOPMENT

Construction and development activities related to the proposed development will create the following benefits in terms of economic impact upon full completion:

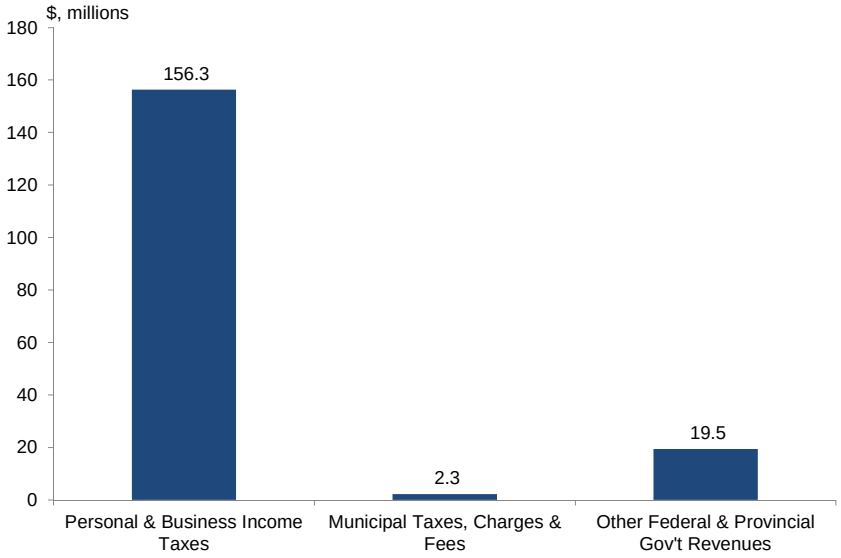

- About **$1.3 billion in economic activity** - $674 million of which is direct economic activity;
- About **$650 million in net contribution to GDP**;
- About **7,435 person-years of employment**;
- About **$415 million in income** for households;
- Some **$270 million in business operating earnings**; and
- **$178 million in tax revenues**, generated across all levels of government.

Economic Benefits Accruing From Construction & Development Activities

Jobs Generated From Construction and Development Activities

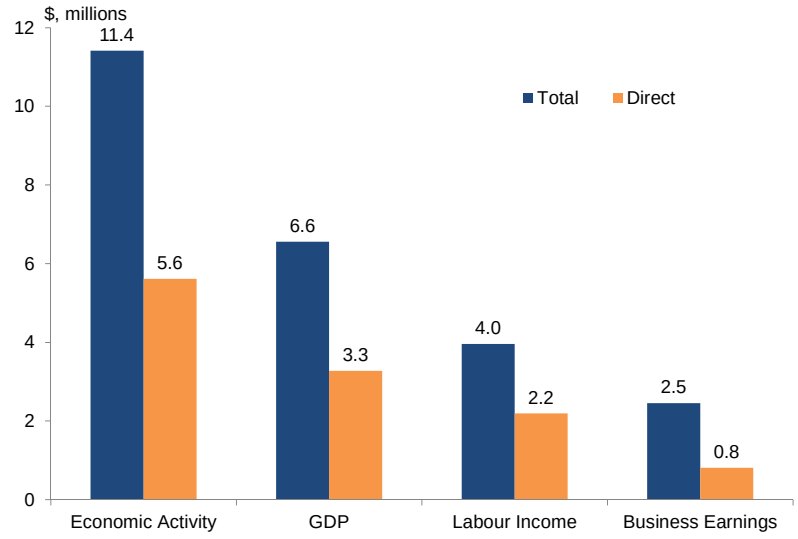

Source: Altus Group Economic Consulting based on Statistics Canada's I/O Model

BENEFITS FROM ON-GOING OPERATIONS

Altus Group estimates that the economic benefits generated from the on-going operation of this newly created development (for a single-year) amounts to:

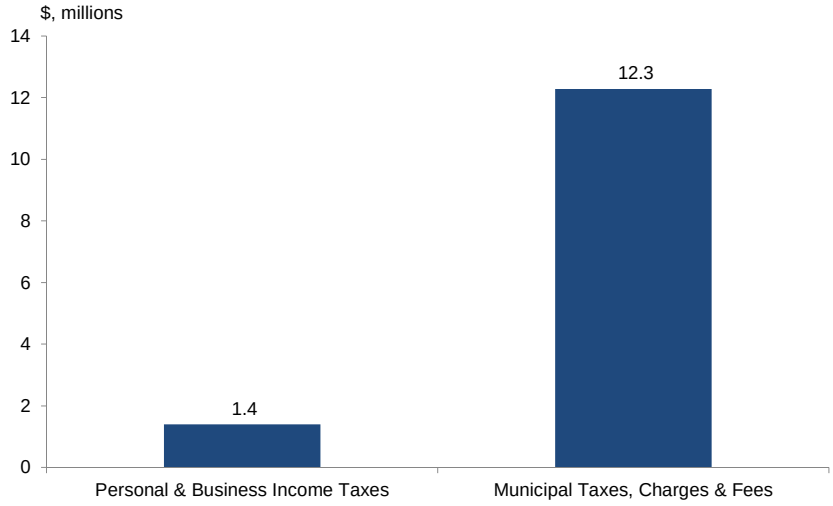

- Over **$11 million in economic activity**;
- About **$6.6 million in net contribution to GDP**;
- **75 person-years of employment**;
- About **$4 million in income** by households;
- **$2.5 million in operating business earnings**; and
- **$14 million in tax revenues**, generated across all levels of government.

The proposed development will provide other benefits:

- The redevelopment of the Parker Lands help **transform an older, underutilized part of the City** by repurposing a largely vacant land parcel into a vibrant, modern neighbourhood with significant park space served by a brand new rapid transit station;
- The development will help **support development goals** set out in the City of Winnipeg's *OurWinnipeg* development plan;
- Some **3.87 acres of natural park space** will be retained in the proposed development allowing local residents in the district the opportunity to benefit from improved physical and psychological health;
- The transit-oriented nature of the proposed development will also generate benefits, **including reduced automobile usage and improved health**;
- The creation of new residential units will help the City **manage its anticipated population growth**;
- The development represents a **significant infusion of new population** into the River-Heights Fort-Garry ward, which has not seen significant population growth in many years; and
- An estimated **$62.5 million of potential retail expenditure** will be introduced into the local ward and beyond, providing a tremendous boost to the many retailers and personal service providers that surround the site.

5 CONCLUSIONS 16

1 INTRODUCTION

6165347 Manitoba Inc. approached Altus Group Economic Consulting to undertake an analysis of the economic benefits arising from the construction and operation of a new residential development in the City of Winnipeg.

1.1 BACKGROUND

In 2008, Altus Group was retained by the City of Winnipeg to prepare a comprehensive employment lands strategy[1]. In the report it was found that the City has an employment land supply of some 1,210 acres that encompasses some 760 acres of vacant parcels and an additional estimated 450 acres of lands considered available for development with existing occupied, but underutilized lands.

The report noted that the Parker Lands had some 96.8 net acres of vacant land. It was recommended that:

"*the Parker Industrial Area be redesignated to a Neighbourhood Policy Area in view of its unsuitability for development as employment lands.*" (pg. 56)

The City of Winnipeg retained Altus' recommendation, designating the Parker Lands as a Major Redevelopment Site (MRS) under the *OurWinnipeg* development plan. *OurWinnipeg* is the current official development plan guiding growth and change for the City of Winnipeg over a 25-year period.

According to *OurWinnipeg*:

"Major Redevelopment Sites will provide transformative opportunities for the development of complete communities with significant residential and employment densities and attractive urban design, capitalizing on vacant or underutilized sites within the existing urban fabric." (OurWinnipeg pg. 37)

In 2009, a vacant land parcel was acquired within the Parker Lands with the intention of transforming it into a major new residential community. This presents a significant opportunity to revitalize an older, underutilized part of the City by repurposing a largely vacant land parcel into a vibrant, modern neighbourhood with significant park space, serviced by a brand new transit line.

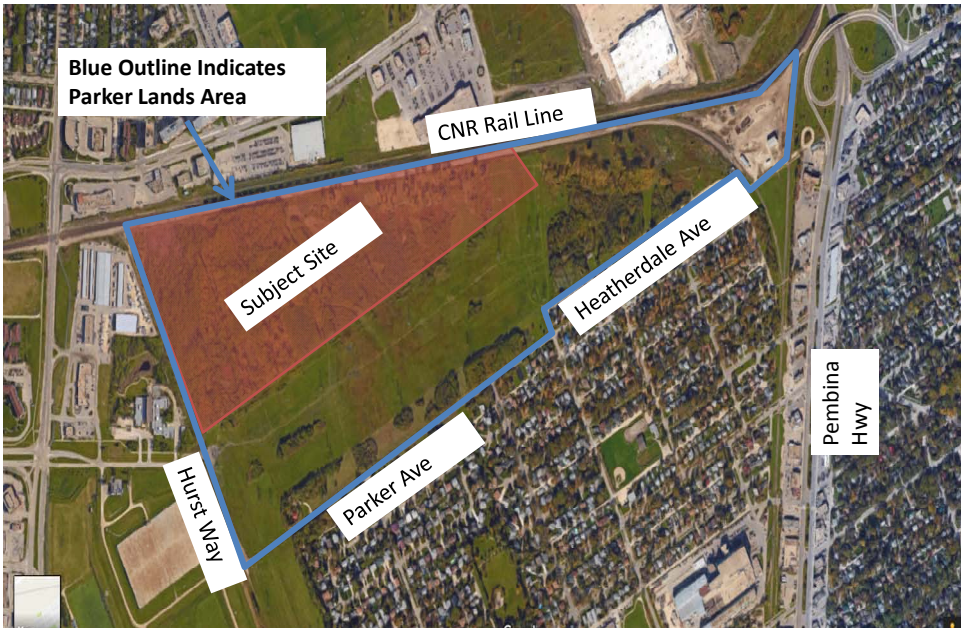

[1] Altus Group, *City of Winnipeg Comprehensive Employment Lands Strategy*, March 2008

1.2 THE PARKER LANDS

The subject site is located on the Parker Lands, situated west of the Pembina Highway, south of the CNR rail line, north of Parker Avenue and Heatherdale Avenue and east of Hurst Way (Figure 1).

Figure 1

Subject Site

Source: Client

Uses surrounding the Parker Lands include:

- Commercial uses to the west;
- Commercial and residential uses to the north;
- Residential uses to the south and;
- Commercial uses to the east.

1.3 THE SUBJECT SITE

A new residential community is planned for the subject site, with some convenience-oriented retail developed to serve new site residents.

The site is planned to include:

- 240 single-family, low-to-medium density units;
- 1,502 multi-family, high-density units;
- New commercial space;
- Some 1,448 new parking spaces;

- 3.87 acres of forest preserved from the current Aspen Forest; and
- Local roads;

In addition, Hurst Way will be extended eastwards into the site (Figure 2).

Figure 2 **Subject Site – Development Plans**

Source: Client

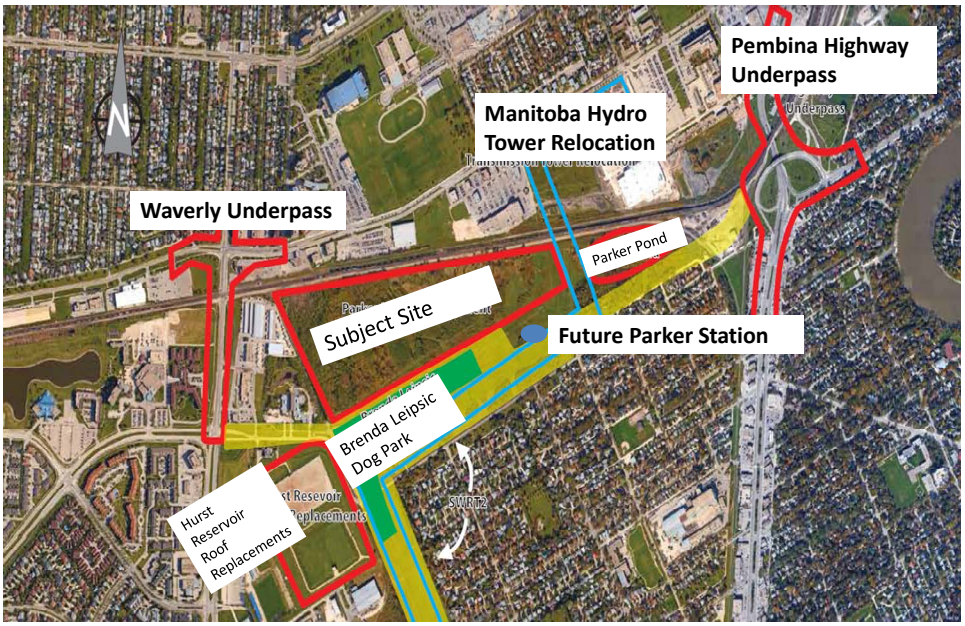

1.4 PUBLIC INVESTMENTS SURROUNDING THE SUBJECT SITE

Significant public investments that are/will be undertaken near the subject site include:

- A deep-water retention pond in the Parker Lands at a cost of $75-$90 million;
- The renewed Brenda Leipsic dog park in the Parker Lands;
- The new $155 million Waverly Underpass;
- The Hurst Reservoir roof replacement project; and
- A Manitoba Hydro transmission tower relocation (Figure 3);

Figure 3

Parker Lands and Nearby Major Projects Under Development

Source: Client

1.4.1 New Transit Station

A new Bus Rapid Transit (BRT) station will be constructed south of the subject site in the Parker Lands. The station is part of the $467 million[2] Southwest Rapid Transitway (Stage 2) and Pembina Highway Underpass Project, on which construction began in August 2016 and is expected to be complete in 2019[3].

The project involves the completion of Stage 2 of the Southwest Transitway, the development of new transportation infrastructure as well as the renewal and expansion of the Pembina Underpass[4].

1.5 ECONOMIC BENEFITS ASSESSED

This report analyzes economic benefits stemming from the new community. The benefits are generated by:

[2] Plenary Group, *Plenary Reaches Financial close on Winnipeg Southwest Rapid Transitway Project*, June 2016. Retrieved from http://plenarygroup.com/news-and-media/news-articles-and-press-releases/2016/plenary-reaches-financial-close-on-winnipeg-southwest-rapid-transitway-project.html

[3] Winnipeg Transit, *Rapid Transit Continues Moving Forward, Preferred Bidder Selected to Construct Southwest Rapid Transitway; Functional Study to be Undertaken for Second Rapid Transit Corridor*, City of Winnipeg, May 13, 2016.

[4] Ibid.

- **The construction of the project**: The construction of the proposed residential community would contribute significantly to Winnipeg's economy and generate substantial "spinoff" benefits; and
- **The ongoing operations of the property**: Main activities related to the on-going operation of the community include maintaining the property, leasing and property management, budgeting improvements and maintaining records. In addition, the new employment accommodated by the commercial uses of the development would generate further economic benefits.

Several measures of economic benefits are assessed in this report:

- **Economic Activity:** the volume of goods and services consumed related to the proposed development, including indirect and induced benefits;
- **Contribution to GDP:** the value added component of the economic activities, a measure of the contribution to Gross Domestic Product from the construction and on-going activities of the proposed development;
- **Jobs**: The number of jobs (person-years of employment) directly and indirectly tied the development, including induced jobs;
- **Income**: The volume of income generated through the construction and operation of the proposed development and income earned by households through wages and other earnings;
- **Taxes, levies and charges**: Estimated taxes, levies and charges generated through construction and on-going operations of the development for all levels of government. Government revenues created from the construction of the development include sales taxes, land transfer taxes, labour and business income taxes, development charges and building permit fees. Government revenues generated from the on-going operations of the facility include property taxes collected from tenants as well as those collected from labour and business income; and
- Other related benefits.

This report presents a review of these estimates. It measures the magnitude of economic benefits to the community from both the construction of the development along with its on-going operation.

This study relies on analysis from the Input Output Model of the Canadian Economy, which is maintained by Statistics Canada.

2 CONTEXT BEHIND ECONOMIC IMPACT ANALYSIS

This report presents analysis on economic impacts from the construction and operation of the new community. These economic benefits are estimated using the Input-Output Multiplier Model developed and maintained by Statistics Canada.

The impact of the construction and on-going operation of the new community will take three principal forms:

- The **Direct Production and Jobs Generated** by expenditures on project construction, and those related to the on-going operation of the development;
- The **Indirect Production and Jobs Generated** from the demand for materials and services used in the direct round of activities. These indirect impacts also include the subsequent rounds of indirect impacts[5]; and
- In addition to the direct and indirect economic production impacts, many economists point to a third round of **"Induced" Economic Impacts** from an economic event. This third round of impacts acknowledges that the increased production in the direct and indirect rounds will itself spur further positive economic effects through the labour income it creates that ultimately stimulates further economic activity through personal consumption. For example, people directly employed (such as construction workers) will spend part of their income on consumption items such as food, rent or recreation, thus supporting jobs in the economy.

[5] For example, for the residential construction – the first round of indirect impacts are jobs created by companies supplying goods or services to the construction process – such as a lumber company – and the second round would be jobs created by companies supplying goods or services to the lumber company – such as the logging companies. Subsequent rounds of impact would be those jobs generated even earlier in the production chain. The same "rounds" of indirect impact also relate to the on-going operations of the development, where the first indirect round would include firms who supply the retailers who will be utilizing the commercial space in the development, who in turn consume other goods and services.

3 ESTIMATED ECONOMIC BENEFITS

3.1 ECONOMIC BENEFITS ASSOCIATED WITH CONSTRUCTION AND DEVELOPMENT ACTIVITIES

Construction and development activities related to the project will deliver tremendous economic benefits by generating:

- About **7,435 person-years** of direct, indirect and induced employment;
- About **$1.3 billion** in direct, indirect and induced economic activity;
- About **$650 million** in net contribution to GDP;
- About **$415 million** in personal income tied to the creation of direct, indirect and induced jobs;
- Some **$270 million** in operating business earnings; and
- Some **$178 million** in tax revenues and other charges for various levels of government (Figure 4).

Figure 4

Estimated Economic Benefits of New Mixed-use Development: Construction and Development Activities

	Direct	Indirect	Induced	Total
Economic Activity ($millions)	673.8	415.8	254.5	1,344.1
Gross Domestic Product ($millions)	249.4	238.1	158.1	645.6

3.2 ECONOMIC BENEFITS ASSOCIATED WITH ON-GOING OPERATIONS

The ongoing operation of the proposed development (for a single-year) will generate:

- Approximately **75 person-years** of direct, indirect and induced employment;
- About **$11 million** in direct, indirect and induced economic activity;
- Some **$6.6 million** in total net contribution to GDP;
- About **$4 million** in personal income from the creation of direct, indirect and induced jobs;
- Some **$2.5 million** in total operating business earnings; and
- Approximately **$14 million** in property, business and income tax revenues for all levels of government (Figure 5).

Figure 5

Estimated Economic Benefits of New Residential Development: On-going Operations (Single-Year)

	Direct	Indirect	Induced	Total
Economic Activity ($millions)	5.6	3.2	2.6	11.4

4 OTHER BENEFITS

4.1 PLANNING AND POLICY

4.1.1 OurWinnipeg

According to Section 01-1 of the *OurWinnipeg* development plan:

…complete communities should provide a range of housing options to accommodate various incomes, household types, abilities and stages of life…offering choices from traditional, single-family neighbourhoods to more dense forms of urban housing and new neighbourhoods…

The development will provide dwelling units in various densities from single-family houses to multi-unit residential buildings, and a range of tenures including rental, freehold owner and condominium to serve the needs of people from different age groups, household types and income levels. This community will provide the type of new, complete community envisioned by the *OurWinnipeg* plan.

4.1.1.1 Complete Communities

Complete Communities, one of four Direction Strategies supporting *OurWinnipeg*, is adopted as the City's land use and development guide. According to *Complete* Communities, the Parker Lands MRS should be developed following principles that:

- Support rapid transit and high-frequency transit service by encouraging higher density residential and higher intensity commercial and mixed uses within the centre of the development. These will be focused on major transit stops;
- Create strong, multi-modal and active transportation linkages;
- Promote development in accordance with Transit Oriented Development (TOD) principles;
- Promote development in accordance with Universal Design and Crime Prevention Through Environmental Design (CPTED) policies; and
- Mitigate any negative impacts new development may have on neighbouring streets, parks and properties.

The subject site and surrounding developments within the Parker Lands MRS comply with the above principles, and will help create complete communities in the City as:

- The previous Hydro Corridor will be transformed to accommodate public uses including the new Southwest Rapid Transit (SWRT) lines and the renewed Brenda Leipsic Dog Park;
- There will be an 18-hour activity zone around the SWRT station, formed by high-density residential buildings with active commercial on ground floors, a Station Plaza, nature parks, active transportation paths and various seasonal uses;
- The development will follow the Guidelines for New Development in Proximity to Railway Operations (May 2013), prepared for the Federation of Canadian Municipalities and the Railway Association of Canada;
- Following CPTED policies, the development will create public spaces that are visible to passers-by, have entrances accessible from the public pedestrian realm and have ground floors that offer a high degree of transparency; and
- New construction will be far enough from the existing neighbourhoods to avoid any negative impacts. Existing trees will be retained, and paths through parks will be universally accessible to minimize impacts on the existing natural environment.

4.1.2 Transportation Master Plan

Rapid transit is stated as an essential component for Winnipeg's on-going growth in the OP. The development of the Southwest Rapid Transitway is recognized as an initial priority in the Transportation Master Plan (TMP). According to the TMP, ridership is projected to be 1,800 passengers per hour at peak hours in the Southwest corridor, and an average density of 76 persons plus jobs per hectare is required to support the rapid transit on the corridor by 2031.

According to the City's TMP:

A key goal in OurWinnipeg is to accommodate a greater proportion of the City's future growth within the existing built boundary. This would be accomplished through redevelopment and intensification in the City's transit-supportive land-use areas: the downtown, mixed-use centres, mixed-use corridors and major

redevelopment sites…In addition, increased density will be needed to justify major transportation investments such as rapid transit.

As a transit-oriented development (TOD) in a MRS that will create 1,742 dwelling units accommodating new a population base, the development is consistent with a key goal set out in the TMP. This is because the increase in density will contribute towards the viability of the SWRT line by boosting ridership and supporting TOD in Winnipeg. Additionally, a well-designed pedestrian network will ensure that the majority of new residents will be within 400m walking distance of the SWRT station, integrating the SWRT corridor as a part of the site.

Additionally, the TMP states that,

A key underlying goal of the transportation plan is to expand the range of travel options that are available to residents, workers and visitors, and to ensure that people are not dependent on one single mode.

The new residential community helps achieve the above goal by providing a network of roads, rapid transit corridors, active transportation routes, pedestrian paths and public spaces to new residents, current residents of nearby neighbourhoods and users of other parts of the Parker Lands. By offering greater access and options for walking, cycling and transit, the proposed development will help build more healthy, livable and socially active communities.

4.2 BENEFITS OF OPEN SPACE

The subject site will retain some 3.87 acres of natural parkland which will be visible and accessible to residents. Additionally, the Parker Lands MRS will be redeveloped to include parks dedicated to both leisure and nature. As part of the redevelopment of the Parker Lands MRS, the Brenda Leipsic Dog Park will be renewed to include new walking paths and activity areas.

Parks are an essential component of any city, offering a broad range of leisure and recreation opportunities, transportation routes and places for residents to experience nature and interact with each other[6]. They also have a variety of health benefits[7] including:

[6] Sherer, P. *The Benefits of Parks: Why America Needs More City Parks and Open Space*. The Trust for Public Land, 2006.

[7] Geis, E. *The Health Benefits of Parks*. The Trust for Public Land, 2006.

- Increased frequency of exercise;
- Improved psychological health;
- Improved social health of communities through making cities more liveable; and
- Mitigating air pollution;

Studies also show clear positive impacts of urban park space and property values. The presence of trees has been found to increase the selling price of a residential unit from 1.9%[8] to 7%[9]. Additionally, studies have found that park space has a positive impact on property values, particularly for those located 1 km or closer to the park[10].

4.3 BENEFITS OF TRANSIT ORIENTED DEVELOPMENT

There are substantive benefits associated with transit-oriented development[11]:

- Those living close to a transit station drive less as their needs can be fulfilled without driving, thereby creating fewer negative impacts from their driving (pollution, noise, congestion);
- These individuals' increased use of public transit generates increased revenue for transit agencies; and
- Those living near transit stations tend to be more frequent walkers, which has health benefits;

Regarding the first point, the reduction of driving by those living close to transit stations would generate savings in vehicle operating and ownership costs. According to a 2013 study by the Canadian Automobile Association (CAA)[12], the costs of operating a vehicle (including fuel, maintenance and tires) is roughly $0.15 per kilometre driven. Furthermore, according to the CAA study, there are also fixed costs of automobile ownership, amounting to $6,500 per year (including insurance, license and registration, depreciation and interest on car loans).

[8] Dombrow et al. *The Market Value of Mature Trees in Single-Family Housing Markets*. Appraisal Journal, January 2000.

[9] Payne, B.R. *The Twenty-nine Tree Home Improvement Plan.* Natural History, 1973.

[10] Smith, D. *Valuing Housing and Green Spaces: Understanding Local Amenities, the Built Environment and House Prices in London.* Greater London Authority: London, U.K., September 2010.

[11] Noland et al., *Measuring Benefits of Transit Oriented Development*. Mineta National Transit Research Consortium, 2014.

[12] Canadian Automobile Association. *Driving Costs.* Canadian Automobile Association, 2013

Reduced driving would also improve the health of the environment. Studies have indicated that each automobile kilometre travelled generates 0.23 kg of CO^2 emissions, and the cost of CO^2 emissions for each kilometre driven is $0.01[13].

4.4 ACCOMMODATING GROWTH

According to the City of Winnipeg, the population of the City is anticipated to increase by some 200,000 individuals from 2015-2040[14]. The proposed development will include some 1,742 new residential units. These new units are estimated to accommodate some 4,180 persons[15]. As a result, the development of this new property will be a key contributor in helping manage the City's anticipated population growth.

4.4.1 Ward Revitalisation

The development will attract over 4,000 new residents to the River-Heights Fort-Garry ward in the City of Winnipeg. Census of Canada data shows that the ward's population has grown by only 270 individuals from 2001 – 2011, or 0.6% per year.

The population of the ward was 4,649 in 2011. This development will result in the ward's population growing by a substantial 95% from its 2011 level, thereby helping to substantially revitalize a mature area in the City.

This new population will also introduce new expenditure potential to the local area and beyond. Statistics Canada's data implies that Manitoba residents spent an estimated $14,953 per person on retail expenditures in 2016[16]. A new population of 4,180 individuals implies that a substantial $62.5 million in new retail expenditures per year could be introduced into the local ward and beyond. This will help strengthen the planned and existing commercial structures in proximity to the Parker Lands.

[13] Region of Waterloo, City of Kitchener et. al. *Innovative Regional Economies and Strategic Infrastructure.* Region of Waterloo, April 2015

[14] City of Winnipeg, *City of Winnipeg Population, Housing and Economic Forecast*. City of Winnipeg, 2016

[15] These estimates are formulated using persons per unit housing estimates contained in the 2011 Census of Canada.

[16] This figure is estimated using Statistics Canada's Retail Trade Survey and the 2016 Census of Canada population estimate for Manitoba.

5 CONCLUSIONS

The construction of a new residential community on the Parker Lands in the City of Winnipeg will generate substantial economic benefits in terms of jobs, GDP, incomes and tax revenues for governments. In addition, it will bring a host of other benefits including revitalizing previously underutilized vacant lands in a manner consistent with the goals outlined in the OurWinnipeg development plan.

Construction and development activities related to the proposed development will create the following benefits in terms of economic impact upon full completion:

- Over **$1.3 billion** in economic activity - **$674 million** of which is direct economic activity;
- About **$650 million** in net contribution to GDP;
- About **7,435** person-years of employment;
- Nearly **$415 million** in income for households;
- Some **$270 million** in business operating earnings; and
- **$178 million** in tax revenues, generated across all levels of government.

It is estimated that the annual economic benefits generated from the on-going operation of the newly created commercial facilities as well as from the management of the property amounts to:

- **$11 million** in economic activity;
- Some **$6.6 million** in total net contribution to GDP;
- About **75 person years** of employment;
- Some **$6.5 million** in labour income and business operating earnings; and
- About **$14 million** in tax revenues generated across all levels of government.

Other benefits include:

- The redevelopment of the Parker Lands will help transform an older, underutilized part of the City by repurposing a largely vacant land parcel into a vibrant, modern neighbourhood with significant park space served by a brand new rapid transit station;

- The development will help support development goals set out in the City of Winnipeg's *OurWinnipeg* development plan;
- Some 3.87 acres of natural park space will be retained in the proposed development allowing local residents in the district the opportunity to benefit from improved physical and psychological health;
- The transit-oriented nature of the proposed development will also generate benefits, including reduced automobile usage and improved health;
- The creation of new residential units will help the City manage its anticipated population growth;
- The development represents a significant infusion of new population into the River-Heights Fort-Garry ward, which has not seen significant population growth in many years; and
- An estimated $62.5 million of potential retail expenditure will be introduced into the local ward and beyond, providing a tremendous boost to the many retailers and personal service providers that surround the site.

PARKER LANDS Major Redevelopment Site

Primary and Secondary Schools Analysis

Introduction

The Parker Lands Major Redevelopment Site are situated in south central Winnipeg and have the distinction of being located in close proximity to the boundaries of two School Divisions: the Winnipeg School Division and Pembina Trails School Division.

School Division Location

The catchment area for the future children in the Parker Lands Major Redevelopment Site would be the Winnipeg School Division, Ward 1 (see map on the following page for Ward location within the City and existing schools within the neighbourhood).

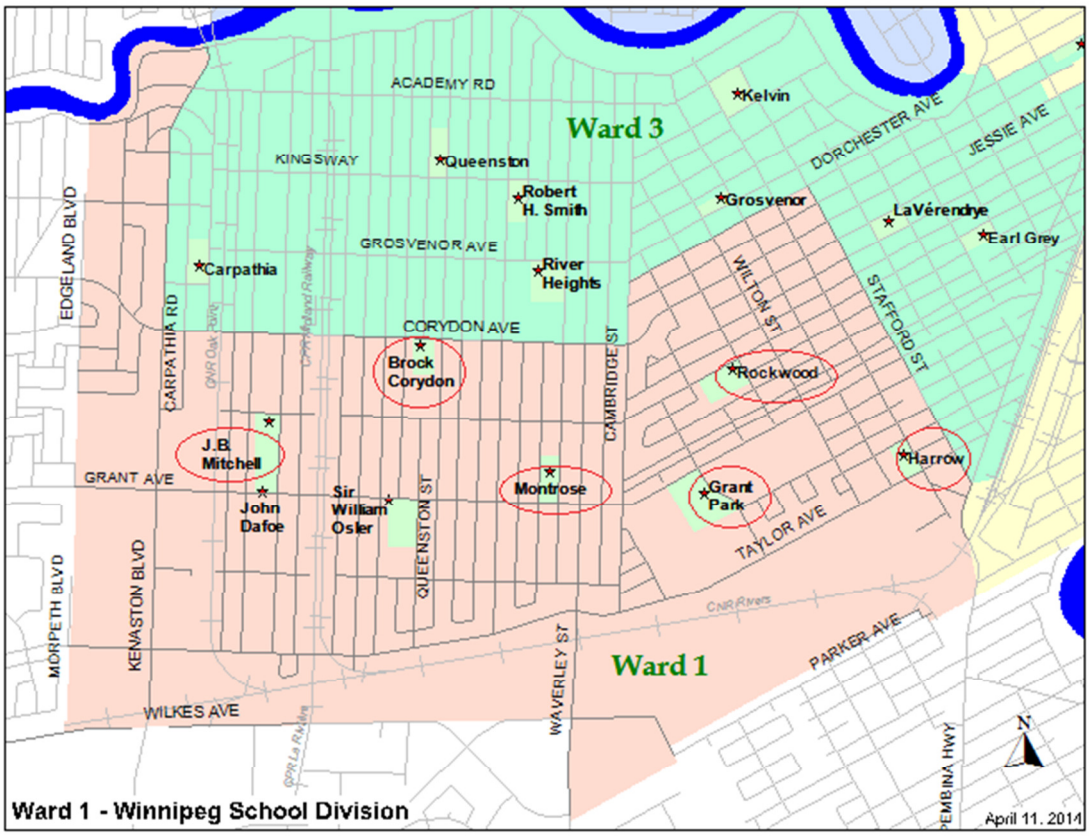

The boundaries of the Ward 1 School Division are Wilkes and Parker Avenues acting as the southern boundary, Morpeth and Edgeland Boulevards to the west, Corydon and Dorchester Avenues to the north and Stafford Street and Pembina Highway as the easternmost boundaries.

Schools within the Ward

The Parker Lands technically fall within the Winnipeg School Division, Ward 1. Schools located within this district are Brock Corydon (N-6), Grant Park High School (7-12), Harrow (N-6), J.B. Mitchell (N-6), Montrose (N-6) and Rockwood School (N-6).

All of these schools, however, are to the north of the CNR Rivers Mainline tracks which acts as a strong buffer and barrier for the Plan Area and could prove difficult and dangerous for young students and children to walk to school.

Winnipeg School Division, Ward 1

Ward 1 includes the following Schools:

Brock Corydon (N-6)	Grant Park High (7-12)
Harrow (N-6)	J. B. Mitchell (N-6)
Montrose (N-6)	Rockwood (N-6)
Sir William Osler (N-2)	

Boundary Description:

From South Division boundary (Wilkes Ave), north on extension of Morpeth Blvd, north along Morpeth Blvd, continue north along Edgeland Blvd to Assiniboine River, east along Assiniboine River to Kenaston Blvd, south along Kenaston Blvd to Corydon Ave, east along Corydon Ave to Cambridge St, north along Cambridge St to Dorchester Ave, east along Dorchester Ave to Stafford St, south along Stafford St to Pembina Hwy, south along Pembina Hwy to South Division boundary (south side of Parker Ave), west along extension of Parker Ave (south side) to Heatherdale Ave, west along north side of Parker Ave to Hurst Way, south along Hurst Way to south side of Parker Ave, continue west along extension of Parker Ave to Waverley St, north along Waverley St to Wilkes Ave, west along Wilkes Ave to extension of Morpeth Blvd (Division boundary).

Enrolment Statistics

Enrolment histories for the 6 schools located with the Plan Area catchment (Ward 1) are shown in the following pages, starting from 1982 until the most current available in 2015.

Observations were made when studying those time periods to compare the years with the highest and lowest enrolment totals compared to the most current available enrolment numbers from 2015.

If it can be assumed that the highest enrolment for a school over its lifetime indicates a potential maximum capacity at the school, then a comparison between that maximum capacity year with the current enrolment year could show the difference of how many students could potentially be placed at the school to again reach that enrolment number.

See the following school enrolment information sheets for each of the schools that illustrate the potential placements available to attain the ‘maximum’ capacity.

Other Ward 1 Schools

The 6 preceding schools are the only ones currently listed on the Winnipeg School Division website as being part of Ward 1. There are, however, two schools within the ward boundary that notably are not included in the list: Sir William Osler School and John Dafoe School.

Sir William Osler School

Sir William Osler School, located at 1600 Grant Avenue in the south River Heights neighbourhood, closed its doors in 1991 due to declining enrolment.

With a small resurgence in population of young families moving in, Sir William Osler re-opened recently in September 2016, but only as a Nursery to Grade 2 French Milieu school.

The plan is to expand to Nursery to Grade 3 in the 2017-2018 school year and continue expanding each subsequent school year as necessary based on the demographics of the neighbourhood.

The enrolment of Sir William Osler in 1991, the year that it closed in June due to declining enrolment, was 200 students from Kindergarten to Grade 6. One can assume that the school still has the capacity to accommodate at least 200 students.

John Dafoe School

Similar to Sir William Osler School, John Dafoe School, located at 1777 Grant Avenue, closed its doors in June of 1991 due to declining enrolment. In 2010 the building was leased for use as a daycare. The location currently operates as a daycare under the name of Carpathia Children's Centre Inc. and occupies 8 classrooms of the building.

The enrolment of John Dafoe in 1991, the year it closed, was 167 students from Nursery to Grade 6. One can assume it could still have the capacity for at least 167 students if it were to be re-purposed for a school.

Other Schools Nearby the Parker Lands

General Byng School

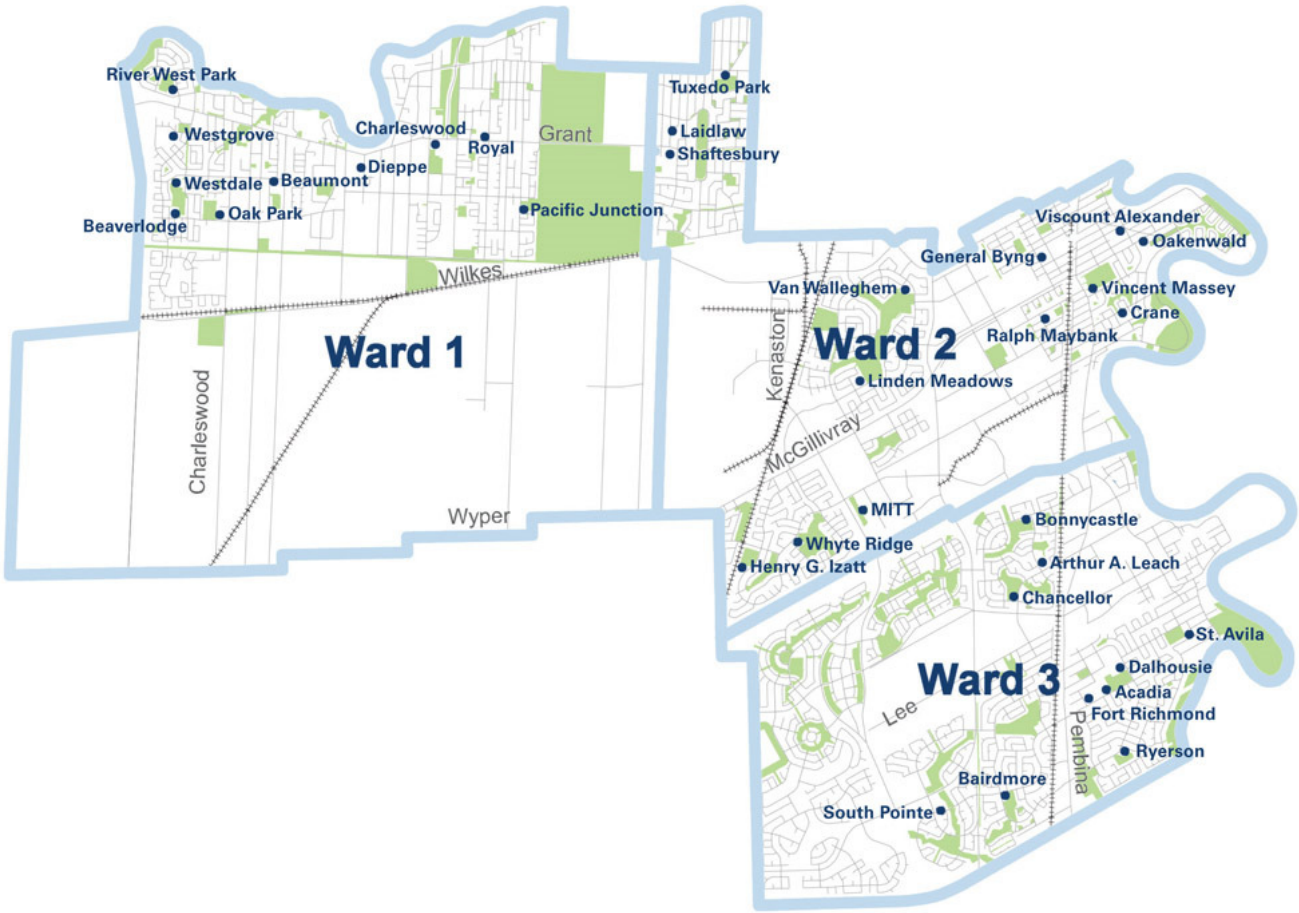

Even though it is not in the catchment area, the nearest public school within walking distance of the Parker Lands Major Redevelopment Site is General Byng School. It is located at 1250 Beaumont Street in the Beaumont Neighbourhood immediately to the south of the Plan Area which is within Ward 2 of the Pembina Trails School Division. It serves students from Kindergarten to Grade 9.

It is located about 500 meters south of Parker Avenue which would represent a little more than a five-minute walk when travelling from that boundary.

Vincent Massey Collegiate / Institut Collegial Vincent Massey

The nearest High School to the Parker Lands associated with the Pembina Trails School Division would be Vincent Massey Collegiate. It serves students from grades 9 to 12 for French immersion and grades 10 to 12 for English and is located to the east across Pembina Highway at 975 Dowker Ave.

Future discussions with the Winnipeg School Division and the Pembina Trails School Division will have to take place to determine final placement for the future students of the proposed new developments within the Parker Lands as safety and convenience may play a factor in determining what is best for the future residents.

Conclusions

All neighbourhoods have a tendency to experience population increases or decreases after many generations of existence. Some areas within the Winnipeg School Division are experiencing an influx of new young families leading to increased enrolments in the nearby schools while others have seen enrolments drop over the last few years.

After studying the enrolments of the schools located within the Winnipeg School Division Ward 1, it can be seen that some available capacity does exist when comparing current enrolment figures with those experienced at the height of their capacities.

Between the six schools identified in this report within the Winnipeg School Division Ward 1 boundaries, the potential available capacity has been identified as a minimum of **252** students.

After a similar look at the schools that are in close proximity to the Plan Area within the neighbouring Pembina Trails School Division, available capacity was identified for a potential additional **162** students.

Between these two school divisions there could be capacity for a minimum of **414** additional students.

However, it must also be remembered that two other schools within the Winnipeg School Division Ward 1 were previously closed in the early 1990's (though one has re-opened late 2016 in limited fashion) and could therefore represent additional capacity if necessary.
