UM

EARTH

2025-2026 Sponsorship Package

Support students making an impact & learning sustainable engineering!

WHO ARE WE?

UM Earth (University of Manitoba) is a student-led engineering organization focused on sustainable water, sanitation, and community infrastructure solutions. We integrate technical design with hands-on fieldwork, producing projects that deliver tangible benefits to communities while equipping students with real-world engineering experience.

UM Earth leads three core initiatives: Global Engineering Brigades, Canadian National Water Treatment Competition (CNWTC), and the Trickle Filter Project. Together these balance international development work with applied research and innovation, ensuring both immediate community impact and long-term technical growth.

PAST PROJECTS:

2020 FESTIVAL DU VOYAGEUR ENERGY STUDY

2019 IISD EXPERIMENTAL LAKES RENEWABLE ENERGY COST BENEFIT ANALYSIS

VERTICAL FARM INSTALLATIONS @ SPEB ENG LONGUE AND SIAF

Water Systems Engineering Brigade to Rural Guatemala

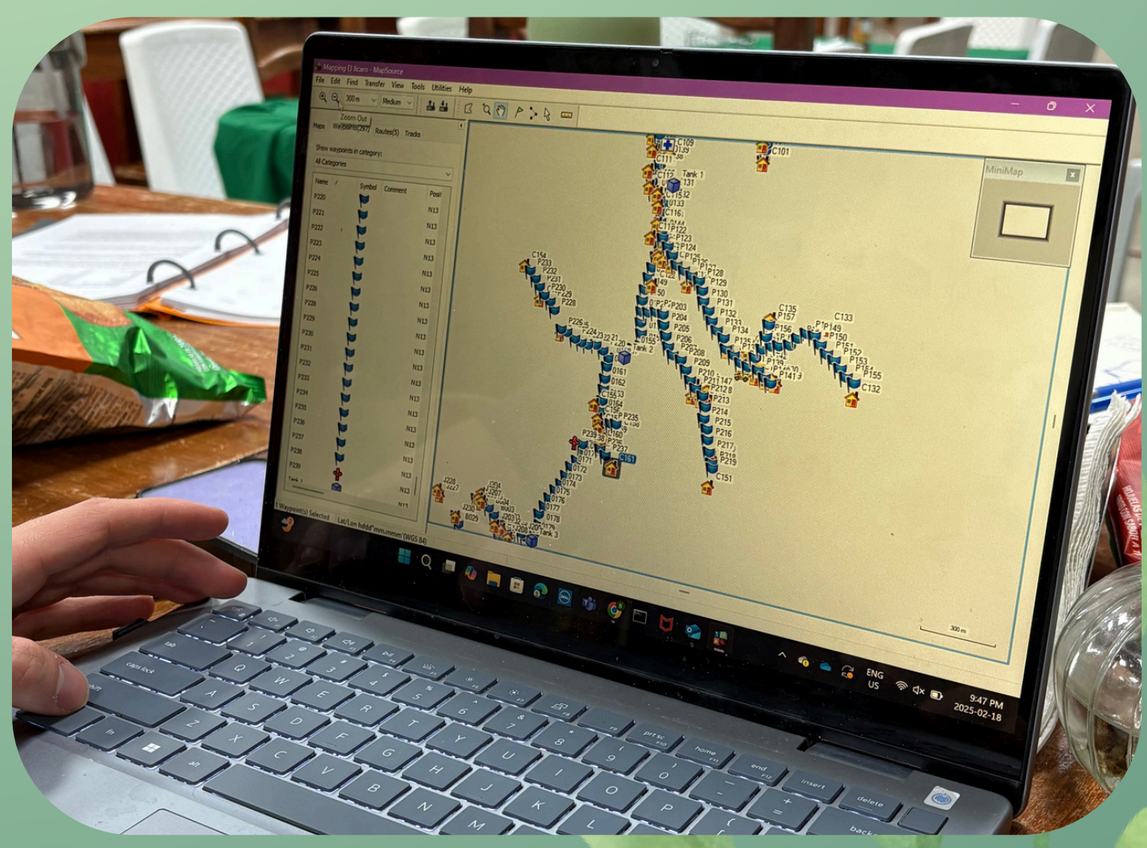

For the past 2 years we have worked with Global Brigades to provide design services to communities in Honduras. The Global Engineering Brigades connects UM Earth students with rural partner communities to co-design and implement sustainable water systems. The next brigade is scheduled for 2026 in Guatemala, with an estimated budget of ~$60,000 and a team of 12–15 students. Past brigades have included detailed pipeline mapping (~14 km with 50 m data points) and on-site collaboration with local residents.

Global Brigade's Holistic 5-Phase Model

1. Community selection — Work with local partners to identify priority needs.
2. Needs assessment & data collection — Gather site data and water quality baselines.
3. Collaborative design — Co-create solutions with stakeholders for cultural and technical fit.
4. Implementation — Carry out construction with student and community teams.
5. Monitoring & sustainability — Train local operators and ensure long-term upkeep.

CANADIAN NATIONAL WATER TREATMENT COMPETITION

CNWTC
CNCTE

The CNWTC brings together student teams from across Canada to design and demonstrate innovative water treatment systems under realistic constraints. 2026 marks UM Earth's first year competing, making this an exciting milestone for our group as we bring our sustainability and design expertise into a national arena.

Through the competition, students:

- Develop engineering skills in water filtration and treatment design.
- Gain experience working under pressure with strict time and resource limits.
- Network with industry experts and connect with students from other universities.
- Strengthen teamwork and communication skills in high-stakes settings.

Participation also provides valuable travel opportunities and exposure to cutting-edge water technologies. It complements UM Earth's local research by allowing students to test and benchmark their designs in a competitive environment, with lessons feeding directly back into projects like the Trickle Filter initiative.

Trickle Filter Research Project

The Trickle Filter Project is a locally based applied research initiative exploring sustainable wastewater treatment through biological filter systems. Operating out of the Sustainability in Action Facility with guidance from Dr. Joe Ackerman, the project nitrifies ammonium-rich greywater to make it safe for environmental release.

Research activities include:

- Testing water quality parameters to evaluate filter performance.
- Determining the time required for full conversion of ammonium to nitrate.
- Comparing different filtering media to identify the most effective designs.
- Exploring nutrient recapture and low-energy filtration to create scalable sustainable solutions.

The Trickle Filter Project provides UM Earth members with hands-on research experience, bridging the gap between classroom learning and practical environmental engineering. It also contributes to the development of affordable, sustainable greywater treatment systems with potential for both local and international application.

WHY SPONSOR?

UM Earth's projects provide students with valuable skills and experiences that extend far beyond the classroom. Our initiatives give students opportunities to apply technical expertise, strengthen problem-solving abilities, and practice communication skills in fast-paced, collaborative environments. For many students, brigades and research projects are their first chance to design and implement real engineering systems with immediate community impact.

The last two brigades not only enriched participants' engineering skills but also reinforced their commitment to sustainable development. Outside of fieldwork, our members gain professional experience through fundraising, presenting to industry leaders, and building networks across Manitoba. These activities prepare our students to enter the workforce with strong community engagement, sustainability, and leadership skills.

Sponsorship directly supports:

- **Community impact** — funding water system design, construction, and long-term sustainability.
- **Student training** — enabling accessible participation for all students regardless of financial background.
- **Local connection**s — linking students, faculty, and industry through shared sustainability goals.

Your contribution acts as both a direct investment in partner communities and in the future engineering workforce of Manitoba.

BECOME A SPONSOR

We value every level of support and strive to provide meaningful recognition and partnership opportunities. Sponsorship tiers can be tailored, and we welcome creative ways to collaborate with our partners.

Platinum : $5000+

Lead sponsor recognition; logo on team kits and primary materials; speaking opportunity at events; feature in final impact report.

Gold : $2500+

Prominent logo placement; social media acknowledgments; recognition in project reports; invitation to technical briefings.

Silver : $1000+

Logo on event materials; inclusion in newsletters; thank-you plaque.

Bronze : $500+

Recognition on website and in reports; social shout-outs.

Sponsorship ensures project viability and reduces the financial burden on individual students, particularly for international brigades. Additional funds beyond system costs help offset travel expenses for team members, ensuring equitable participation.

WE LOOK FORWARD TO WORKING WITH YOU!

2025-2025 Executive Team:

- Ian Clark & Christina Rogalsky (Co-Presidents)
- Autumn Neufeld (VP Operations)
- Bella Coreau (VP External)
- Odin Domino (VP Finance)
- Joyce Ibrahim (Events Lead)
- Pablo Guerrero (Communications Lead)
- Aliya Wong (Secretary)
